# The von Neumann Algebras of Quantum Permutation Groups

Michael Brannan Queen's University

CMS Winter Meeting December 10, 2011.

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Consider a finite set of n points X<sub>n</sub> = {1,2,...,n}. Recall that Aut(X<sub>n</sub>) ≅ Aut(C(X<sub>n</sub>)) ≅ S<sub>n</sub>, the permutation group.

- Consider a finite set of n points X<sub>n</sub> = {1, 2, ..., n}. Recall that Aut(X<sub>n</sub>) ≅ Aut(C(X<sub>n</sub>)) ≅ S<sub>n</sub>, the permutation group.
- Today's Goal: To study the analogue of S<sub>n</sub> within the framework of compact quantum groups, and discuss some of their operator algebraic aspects.

- Consider a finite set of n points X<sub>n</sub> = {1, 2, ..., n}. Recall that Aut(X<sub>n</sub>) ≅ Aut(C(X<sub>n</sub>)) ≅ S<sub>n</sub>, the permutation group.
- Today's Goal: To study the analogue of S<sub>n</sub> within the framework of compact quantum groups, and discuss some of their operator algebraic aspects.
- ► To quantize S<sub>n</sub>: Replace S<sub>n</sub> with the Hopf algebra C(S<sub>n</sub>), then "deform" C(S<sub>n</sub>) to get a genuine quantum group.
- Let U : S<sub>n</sub> → M<sub>n</sub>(ℂ); U(g) = [u<sub>ij</sub>(g)] ∈ M<sub>n</sub>(ℂ) be the "permutation matrix" representation.
- ► Easy to check: The coordinate functions u<sub>ij</sub> : S<sub>n</sub> → C generate C(S<sub>n</sub>), obviously commute, and satisfy:

 $u_{ij} = u_{ij}^* = u_{ij}^2$  and  $U = [u_{ij}]$  is unitary in  $M_n(C(S_n))$ .

- Consider a finite set of n points X<sub>n</sub> = {1, 2, ..., n}. Recall that Aut(X<sub>n</sub>) ≅ Aut(C(X<sub>n</sub>)) ≅ S<sub>n</sub>, the permutation group.
- Today's Goal: To study the analogue of S<sub>n</sub> within the framework of compact quantum groups, and discuss some of their operator algebraic aspects.

 $u_{ij} = u_{ij}^* = u_{ij}^2$  and  $U = [u_{ij}]$  is unitary in  $M_n(C(S_n))$ .

Hopf algebra maps  $\Delta, \kappa, \epsilon$  on  $C(S_n)$  encode group structure of  $S_n$ :

$$\Delta u_{ij} = \sum_{k} u_{ik} \otimes u_{kj}, \qquad \underbrace{\kappa(u_{ij}) = u_{ji}}_{\text{co-inverse } \kappa f(x) = f(x^{-1})}, \qquad \underbrace{\epsilon(u_{ij}) = \delta_{ij}}_{\text{co-unit } \epsilon f = f(e)}$$

(ロ)、(型)、(E)、(E)、(E)、(O)へ(C)

## The quantum permutation group $S_n^+$

#### Definition/Theorem (Wang 1998)

Consider the universal unital C\*-algebra

$$A_{s}(n) = C^{*} \Big( \{ v_{ij} \}_{i,j=1}^{n} \mid V = [v_{ij}] \text{ is unitary } \& v_{ij} = v_{ij}^{2} = v_{ij}^{*} \Big),$$

and endow  $A_s(n)$  with a Hopf C\*-algebra structure just like  $C(S_n)$ :

$$\begin{array}{ll} (\text{coproduct}) \ \Delta : A_s(n) \to A_s(n) \otimes A_s(n); & \Delta v_{ij} = \sum_k v_{ik} \otimes v_{kj}, \\ (\text{co-inverse}) \ \kappa : A_s(n) \to A_s(n)^{\text{op}}; & \kappa(v_{ij}) = v_{ji}, \\ (\text{co-unit}) \ \epsilon : A_s(n) \to \mathbb{C}; & \epsilon(v_{ij}) = \delta_{ij}. \end{array}$$

## The quantum permutation group $S_n^+$

#### Definition/Theorem (Wang 1998)

Consider the universal unital C\*-algebra

$$A_{s}(n) = C^{*} \Big( \{ v_{ij} \}_{i,j=1}^{n} \mid V = [v_{ij}] \text{ is unitary } \& v_{ij} = v_{ij}^{2} = v_{ij}^{*} \Big),$$

and endow  $A_s(n)$  with a Hopf C<sup>\*</sup>-algebra structure just like  $C(S_n)$ :

$$\begin{array}{ll} (\text{coproduct}) \ \Delta : A_s(n) \to A_s(n) \otimes A_s(n); & \Delta v_{ij} = \sum_k v_{ik} \otimes v_{kj}, \\ (\text{co-inverse}) \ \kappa : A_s(n) \to A_s(n)^{\text{op}}; & \kappa(v_{ij}) = v_{ji}, \\ (\text{co-unit}) \ \epsilon : A_s(n) \to \mathbb{C}; & \epsilon(v_{ij}) = \delta_{ij}. \end{array}$$

 $\implies$   $S_n^+ := (A_s(n), \Delta, \kappa, \epsilon)$  is a compact quantum group, called the **quantum permutation group**.

# The quantum permutation group $S_n^+$

#### Definition/Theorem (Wang 1998)

Consider the universal unital C\*-algebra

$$A_{s}(n) = C^{*} \Big( \{ v_{ij} \}_{i,j=1}^{n} \mid V = [v_{ij}] \text{ is unitary } \& v_{ij} = v_{ij}^{2} = v_{ij}^{*} \Big),$$

and endow  $A_s(n)$  with a Hopf C<sup>\*</sup>-algebra structure just like  $C(S_n)$ :

$$\begin{array}{ll} (\text{coproduct}) \ \Delta : A_s(n) \to A_s(n) \otimes A_s(n); & \Delta v_{ij} = \sum_k v_{ik} \otimes v_{kj}, \\ (\text{co-inverse}) \ \kappa : A_s(n) \to A_s(n)^{\text{op}}; & \kappa(v_{ij}) = v_{ji}, \\ (\text{co-unit}) \ \epsilon : A_s(n) \to \mathbb{C}; & \epsilon(v_{ij}) = \delta_{ij}. \end{array}$$

 $\implies$   $S_n^+ := (A_s(n), \Delta, \kappa, \epsilon)$  is a compact quantum group, called the **quantum permutation group**.

- ▶ Note:  $\exists$  natural quotient maps  $A_s(n) \twoheadrightarrow C(S_n) \implies S_n < S_n^+$ .
- ► Terminology "quantum permutation group" is justified: S<sup>+</sup><sub>n</sub> is the universal quantum automorphism group acting on C(X<sub>n</sub>).

►  $S_n^+$  has a unique **Haar integral**. I.e., a state  $h : A_s(n) \to \mathbb{C}$ , which is  $\Delta$ -invariant:

$$(h \otimes id)\Delta(x) = (id \otimes h)\Delta(x) = h(x)1.$$

Do the GNS construction:

 $L^2(S_n^+) = L^2(A_S(n), h), \quad \lambda : A_s(N) \to \mathcal{B}(L^2(S_n^+))$  GNS representation.

< ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

►  $S_n^+$  has a unique **Haar integral**. I.e., a state  $h : A_s(n) \to \mathbb{C}$ , which is  $\Delta$ -invariant:

$$(h \otimes id)\Delta(x) = (id \otimes h)\Delta(x) = h(x)1.$$

Do the GNS construction:

 $L^2(S_n^+) = L^2(A_S(n), h), \quad \lambda : A_s(N) \to \mathcal{B}(L^2(S_n^+))$  GNS representation.

Get the reduced C\*-algebra and reduced von Neumann algebra:

$$C_{\mathrm{red}}(S_n^+) = \lambda(A_s(n)) \subset \mathcal{B}(L^2(S_n^+)), \quad L^{\infty}(S_n^+) := \lambda(A_s(n))''.$$

▶  $S_n^+$  has a unique **Haar integral**. I.e., a state  $h : A_s(n) \to \mathbb{C}$ , which is  $\Delta$ -invariant:

$$(h \otimes id)\Delta(x) = (id \otimes h)\Delta(x) = h(x)1.$$

Do the GNS construction:

 $L^2(S_n^+) = L^2(A_S(n), h), \quad \lambda : A_s(N) \to \mathcal{B}(L^2(S_n^+))$  GNS representation.

Get the reduced C\*-algebra and reduced von Neumann algebra:

$$C_{\mathrm{red}}(S_n^+) = \lambda(A_s(n)) \subset \mathcal{B}(L^2(S_n^+)), \quad L^{\infty}(S_n^+) := \lambda(A_s(n))''.$$

▶ Heuristic Model:  $A_s(N) = C^*_{\text{full}}(\widehat{S_n^+}), \ C_{\text{red}}(S_n^+) = C^*_{\text{red}}(\widehat{S_n^+})$  and  $L^{\infty}(S_n^+) = \mathcal{L}(\widehat{S_n^+})$ , where  $\widehat{S_n^+}$  is the dual discrete quantum group.

►  $S_n^+$  has a unique **Haar integral**. I.e., a state  $h: A_s(n) \to \mathbb{C}$ , which is  $\Delta$ -invariant:

$$(h \otimes id)\Delta(x) = (id \otimes h)\Delta(x) = h(x)1.$$

Do the GNS construction:

 $L^2(S_n^+) = L^2(A_S(n), h), \quad \lambda : A_s(N) \to \mathcal{B}(L^2(S_n^+))$  GNS representation.

Get the reduced C\*-algebra and reduced von Neumann algebra:

$$C_{\mathrm{red}}(S_n^+) = \lambda(A_s(n)) \subset \mathcal{B}(L^2(S_n^+)), \quad L^{\infty}(S_n^+) := \lambda(A_s(n))''.$$

Heuristic Model: A<sub>s</sub>(N) = C<sup>\*</sup><sub>full</sub>(S<sup>+</sup><sub>n</sub>), C<sub>red</sub>(S<sup>+</sup><sub>n</sub>) = C<sup>\*</sup><sub>red</sub>(S<sup>+</sup><sub>n</sub>) and L<sup>∞</sup>(S<sup>+</sup><sub>n</sub>) = L(S<sup>+</sup><sub>n</sub>), where S<sup>+</sup><sub>n</sub> is the dual discrete quantum group.
 We will mainly focus on the structure of L<sup>∞</sup>(S<sup>+</sup><sub>n</sub>).

- (Wang 1998) If  $1 \le n \le 3$ ,  $A_s(n) \cong C(S_n)$ . I.e.,  $S_n = S_n^+$ .
- (Wang 1998) If  $n \ge 4$ ,  $A_s(n)$ ,  $C_{red}(S_n^+)$ , and  $L^{\infty}(S_n^+)$ ) are non-commutative and infinite dimensional.

- ▶ (Wang 1998) If  $1 \le n \le 3$ ,  $A_s(n) \cong C(S_n)$ . I.e.,  $S_n = S_n^+$ .
- ▶ (Wang 1998) If  $n \ge 4$ ,  $A_s(n)$ ,  $C_{red}(S_n^+)$ , and  $L^{\infty}(S_n^+)$ ) are non-commutative and infinite dimensional.
- (Wang 1998) The Haar state h is always a trace  $\implies L^{\infty}(S_n^+)$  is a finite vN. algebra

- ▶ (Wang 1998) If  $1 \le n \le 3$ ,  $A_s(n) \cong C(S_n)$ . I.e.,  $S_n = S_n^+$ .
- (Wang 1998) If  $n \ge 4$ ,  $A_s(n)$ ,  $C_{red}(S_n^+)$ , and  $L^{\infty}(S_n^+)$ ) are non-commutative and infinite dimensional.
- (Wang 1998) The Haar state h is always a trace  $\implies L^{\infty}(S_n^+)$  is a finite vN. algebra

▶ (Banica 1999)  $L^{\infty}(S_n^+)/C_{red}(S_n^+)$  injective/nuclear iff  $n \leq 4$ .

- ▶ (Wang 1998) If  $1 \le n \le 3$ ,  $A_s(n) \cong C(S_n)$ . I.e.,  $S_n = S_n^+$ .

#### Question (Banica+Collins 2008)

What can be said about  $L^{\infty}(S_n^+)$   $n \ge 5$ ? Is it a  $I_1$ -factor?

In the non-injective regime  $n \ge 5$ :

Theorem (B. 2011)

If  $n \ge 8$ ,  $L^{\infty}(S_n^+)$  is a full type  $II_1$ -factor. Moreover,  $L^{\infty}(S_n^+)$  has the Haagerup property (HP) for all  $n \ge 5$ .

In the non-injective regime  $n \ge 5$ :

## Theorem (B. 2011)

If  $n \ge 8$ ,  $L^{\infty}(S_n^+)$  is a full type  $II_1$ -factor. Moreover,  $L^{\infty}(S_n^+)$  has the Haagerup property (HP) for all  $n \ge 5$ .

#### Note:

A finite vN. algebra (M, τ) has the HP if ∃ a net of τ-preserving, normal, UCP maps Φ<sub>t</sub> : M → M s.t.

1.  $\forall t, \Phi_t : L^2(M, \tau) \rightarrow L^2(M, \tau)$  is compact,

2. 
$$\forall x \in M$$
,  $\lim_t \|\Phi_t x - x\|_2 = 0$ .

In the non-injective regime  $n \ge 5$ :

## Theorem (B. 2011)

If  $n \ge 8$ ,  $L^{\infty}(S_n^+)$  is a full type  $II_1$ -factor. Moreover,  $L^{\infty}(S_n^+)$  has the Haagerup property (HP) for all  $n \ge 5$ .

#### Note:

- A finite vN. algebra (M, τ) has the HP if ∃ a net of τ-preserving, normal, UCP maps Φ<sub>t</sub> : M → M s.t.
  - 1.  $\forall t, \Phi_t : L^2(M, \tau) \rightarrow L^2(M, \tau)$  is compact,

2. 
$$\forall x \in M$$
,  $\lim_t \|\Phi_t x - x\|_2 = 0$ .

• A  $II_1$ -factor  $(M, \tau)$  is **full (or non-Gamma)** if for any sequence

$$\{x_n\}_n \subset \mathcal{U}(M) \quad \text{s.t.} \quad \|x_n y - y x_n\|_2 \to 0 \ \forall y \in M, \\ \implies \|x_n - \tau(x_n)\mathbf{1}\|_2 \to 0.$$

In the non-injective regime  $n \ge 5$ :

## Theorem (B. 2011)

If  $n \ge 8$ ,  $L^{\infty}(S_n^+)$  is a full type  $II_1$ -factor. Moreover,  $L^{\infty}(S_n^+)$  has the Haagerup property (HP) for all  $n \ge 5$ .

#### Note:

- A finite vN. algebra (M, τ) has the HP if ∃ a net of τ-preserving, normal, UCP maps Φ<sub>t</sub> : M → M s.t.
  - 1.  $\forall t, \Phi_t : L^2(M, \tau) \to L^2(M, \tau)$  is compact,

2. 
$$\forall x \in M$$
,  $\lim_t \|\Phi_t x - x\|_2 = 0$ .

A  $II_1$ -factor  $(M, \tau)$  is full (or non-Gamma) if for any sequence

$$\{x_n\}_n \subset \mathcal{U}(M) \quad \text{s.t.} \quad \|x_n y - y x_n\|_2 \to 0 \ \forall y \in M, \\ \implies \|x_n - \tau(x_n) 1\|_2 \to 0.$$

 Classical examples of vN. algebras with above properties are L(F<sub>n</sub>), n ≥ 2 (or L(Γ) for any non-amenable i.c.c. hyperbolic group Γ).

► Factoriality/fullness remains open when  $5 \le n \le 7!$ 

Our analysis of  $L^{\infty}(S_n^+)$  is based on the **representation theory** of  $S_n^+$ .

Our analysis of  $L^{\infty}(S_n^+)$  is based on the **representation theory** of  $S_n^+$ . Definition

A *d*-dimensional unitary representation of  $S_n^+$  is a unitary operator  $W = [w_{ij}] \in M_d(A_S(n))$  s.t.  $\Delta w_{ij} = \sum_{k=1}^d w_{ik} \otimes w_{kj} \ \forall i, j.$

#### Theorem (Banica 1999)

 $\exists$  a maximal family of inequivalent finite dimensional irreducible unitary reps.  $\{W^x\}_{x=0}^{\infty}$ , where  $W^x = [w_{ij}^x] \in M_{d_x}(A_s(n))$ , such that

• 
$$W^0 = \mathbb{1}_{\mathcal{A}_s(\mathcal{N})}, \ \mathcal{V} \cong W^0 \oplus W^1,$$

• 
$$W^x \sim \overline{W^x}$$
,  $(x \ge 0)$ .

▶  $W^1 \boxtimes W^x \sim W^{x+1} \oplus W^x \oplus W^{x-1}$ ,  $(x \ge 1)$  "fusion rules".

Our analysis of  $L^{\infty}(S_n^+)$  is based on the **representation theory** of  $S_n^+$ . Definition

A *d*-dimensional unitary representation of  $S_n^+$  is a unitary operator  $W = [w_{ij}] \in M_d(A_S(n))$  s.t.  $\Delta w_{ij} = \sum_{k=1}^d w_{ik} \otimes w_{kj} \ \forall i, j.$ 

**Obvious examples:** Trivial representation  $1_{A_s(n)} \in A_s(n)$ , fundamental representation  $V = [v_{ij}] \in M_n(A_s(n))$ . **Usual constructions:** Direct sum  $W^1 \oplus W^2$ , tensor products  $W^1 \boxtimes W^2 = [w_{ij}^1 w_{kl}^2] \in M_{d_1d_2}(A_s(n))$ , conjugate representation

 $\overline{W} = [w_{ii}^*]$ , unitary equivalence  $\sim$  and irreducibility.

## Theorem (Banica 1999)

 $\exists$  a maximal family of inequivalent finite dimensional irreducible unitary reps.  $\{W^x\}_{x=0}^{\infty}$ , where  $W^x = [w_{ij}^x] \in M_{d_x}(A_s(n))$ , such that

• 
$$W^0 = \mathbb{1}_{\mathcal{A}_s(N)}$$
,  $V \cong W^0 \oplus W^1$ ,

• 
$$W^x \sim \overline{W^x}$$
,  $(x \ge 0)$ .

•  $W^1 \boxtimes W^x \sim W^{x+1} \oplus W^x \oplus W^{x-1}$ ,  $(x \ge 1)$  "fusion rules".

Peter-Weyl decomposition of  $L^2$ :  $L^2(S_n^+) = \bigoplus_{x \ge 0} L_x^2(S_n^+), \quad L_x^2(S_n^+) = span\{\Lambda_h(w_{ij}^x) : 1 \le i, j \le d_x\}.$ 

To study the HP, we search for a simple class of NUCP maps on  $L^{\infty}(S_n^+)$ : To each  $\psi \in \ell^{\infty}(\mathbb{N}_0)$ , associate

$$M_{\psi} = \bigoplus_{x \ge 0} \psi(x) \mathrm{id}_{L^2(S_n^+)} \in \mathcal{B}(L^2(S_n^+)).$$
