Abstract

From the mid-forties of the last century there were no uniqueness theorems for three-dimensional inverse scattering problems with non-over-determined data. Such theorems are now proved.

First we present the uniqueness theorem for inverse obstacle scattering problem ([7], [8]). Let $A(\beta, \alpha, k)$ be the scattering amplitude, and $A(\beta) := A(\beta, \alpha_0, k_0)$, where $\alpha_0$ and $k_0 > 0$ are fixed.

**Theorem 0** The surface $S$ of a bounded obstacle and the boundary condition on $S$ are uniquely determined by the data $A(\beta)$ known for all $\beta$ on an open subset of the unit sphere $S^2$.

Let $A(\beta, \alpha, k)$ be the scattering amplitude corresponding to a real-valued compactly supported potential, $\alpha \in S^2$ is the direction of the incident plane wave, $\beta \in S^2$ is the direction of the scattered wave, $k > 0$ is the wave number, $S^2$ is the unit sphere in $\mathbb{R}^3$.

The Schrödinger equation $[\nabla^2 + k^2 - q(x)]u = 0, \ x \in \mathbb{R}^3$, is the governing equation.

For potentials $q \in H^\ell_0, \ell > 3$, where $H^\ell_0$ is the Sobolev space of functions with compact support, the inverse scattering problem with backscattering data has at most one solution.

The following uniqueness theorem is proved:

**Theorem 1.** If $A_{q_1}(-\beta, \beta, k) = A_{q_2}(-\beta, \beta, k) \ \forall \beta \in S^2, \ \forall k \in (k_0, k_1)$, and $q_1, q_2 \in H^\ell_0, \ell > 3$, then $q_1 = q_2$.

Here $S^2_1$ is an arbitrarily small open subset of $S^2$, and the interval $|k_0 - k_1| > 0$ can be arbitrarily small.

Under the same assumptions on the class of the potentials, the following uniqueness theorem holds:

**Theorem 2.** If $A_{q_1}(\beta, \alpha_0, k) = A_{q_2}(\beta, \alpha_0, k) \ \forall \beta \in S^2, \ \forall k \in (k_0, k_1)$, and for a fixed $\alpha_0 \in S^2$, then $q_1 = q_2$.

The uniqueness theorems for inverse scattering problems with fixed-energy data are proved in the monograph [6].
