

ON PURELY DISCONTINUOUS ADDITIVE FUNCTIONALS OF SUBORDINATE BROWNIAN MOTIONS

VANJA WAGNER

Let $A_t = \sum_{s \leq t} F(X_{s-}, X_s)$ be a purely discontinuous additive functional of a subordinate Brownian motion $X = (X_t, P_x)$. We give a sufficient condition on the non-negative function F that guarantees that finiteness of A_∞ implies finiteness of its expectation. This result is then applied to study the relative entropy of P_x and the probability measure induced by a purely discontinuous Girsanov transform of the process X . We prove these results under the weak global scaling condition on the Laplace exponent of the underlying subordinator. The talk is based on the jointwork with Zoran Vondraček.
