Let  $k_n \sim \alpha \log n$  as  $n \rightarrow \infty$  for some  $\alpha \in (0, e)$ . Then

$$\frac{X_n(\lfloor k_n \rfloor)}{\mathbb{E}X_n(\lfloor k_n \rfloor)} \xrightarrow{d} X(\alpha), \quad n \rightarrow \infty,$$

where  $X_n(k)$  is the number of vertices at level  $k$  of a random recursive tree with  $n + 1$  vertices. Here,

$$X(\alpha) \stackrel{d}{=} \alpha U^\alpha X'(\alpha) + (1 - U)^\alpha X''(\alpha),$$

where  $X'(\alpha)$  and  $X''(\alpha)$  are independent copies of  $X(\alpha)$  which are also independent of a random variable  $U$  having a uniform distribution on  $(0, 1)$ .
