

# Two-sided skew braces

Senne Trappeniers

July 11, 2022

## Jacobson radical rings

### Definition

A ring  $R$  is a *Jacobson radical ring* if it coincides with its own Jacobson radical.

Let  $R$  be a ring, then  $(R, \circ)$  with  $\mathbf{a} \circ \mathbf{b} = \mathbf{a} + \mathbf{b} + \mathbf{ab}$  is a monoid.

## Jacobson radical rings

### Definition

A ring  $R$  is a *Jacobson radical ring* if it coincides with its own Jacobson radical.

Let  $R$  be a ring, then  $(R, \circ)$  with  $\mathbf{a \circ b = a + b + ab}$  is a monoid.

### Proposition

A ring  $R$  is a *Jacobson radical ring* if and only if  $(R, \circ)$  is a group.

## Jacobson radical rings

### Definition

A ring  $R$  is a *Jacobson radical ring* if it coincides with its own Jacobson radical.

Let  $R$  be a ring, then  $(R, \circ)$  with  $\mathbf{a} \circ \mathbf{b} = \mathbf{a} + \mathbf{b} + \mathbf{ab}$  is a monoid.

### Proposition

A ring  $R$  is a *Jacobson radical ring* if and only if  $(R, \circ)$  is a group.

In this case, for all  $\mathbf{a}, \mathbf{b}, \mathbf{c} \in R$ :

$$\mathbf{a} \circ (\mathbf{b} + \mathbf{c}) = \mathbf{a} \circ \mathbf{b} - \mathbf{a} + \mathbf{a} \circ \mathbf{c}, \quad (1)$$

$$(\mathbf{a} + \mathbf{b}) \circ \mathbf{c} = \mathbf{a} \circ \mathbf{c} - \mathbf{c} + \mathbf{b} \circ \mathbf{c}. \quad (2)$$

## Braces

Observation Rump: Jacobson radical rings give set-theoretic solutions of the YBE.

### Definition ([Rum07])

A *(left) brace* is a triple  $(\mathbf{A}, +, \circ)$  such that

1.  $(\mathbf{A}, +)$  is an abelian group,
2.  $(\mathbf{A}, \circ)$  is a group,
3. equation (1) holds.

If also equation (2) holds, then  $(\mathbf{A}, +, \circ)$  is a *two-sided brace*.

## Braces

Observation Rump: Jacobson radical rings give set-theoretic solutions of the YBE.

### Definition ([Rum07])

A (*left*) *brace* is a triple  $(\mathbf{A}, +, \circ)$  such that

1.  $(\mathbf{A}, +)$  is an abelian group,
2.  $(\mathbf{A}, \circ)$  is a group,
3. equation (1) holds.

If also equation (2) holds, then  $(\mathbf{A}, +, \circ)$  is a *two-sided brace*.

Bijjective correspondence:

$$\begin{array}{ccc} \{\text{two-sided braces}\} & \longleftrightarrow & \{\text{Jacobson radical rings}\}, \\ (\mathbf{A}, +, \circ) & \mapsto & (\mathbf{A}, +, *), \end{array}$$

where  $\mathbf{a} * \mathbf{b} = -\mathbf{a} + \mathbf{a} \circ \mathbf{b} - \mathbf{b}$ .

## Skew braces

### Definition ([GV17])

A *skew (left) brace* is a triple  $(\mathbf{A}, +, \circ)$  such that

1.  $(\mathbf{A}, +)$  is a group,
2.  $(\mathbf{A}, \circ)$  is a group,
3. equation (1) holds.

If also equation (2) holds, then  $(\mathbf{A}, +, \circ)$  is a *two-sided skew brace*.

## Skew braces

### Definition ([GV17])

A *skew (left) brace* is a triple  $(\mathbf{A}, +, \circ)$  such that

1.  $(\mathbf{A}, +)$  is a group,
2.  $(\mathbf{A}, \circ)$  is a group,
3. equation (1) holds.

If also equation (2) holds, then  $(\mathbf{A}, +, \circ)$  is a *two-sided skew brace*.

- ▶ Two-sided braces: well-studied,
- ▶ Two-sided skew braces: besides [Nas19], not much is known.

## Opposite skew braces

### Example (Trivial skew brace)

Let  $(\mathbf{A}, \circ)$  be a group, then  $(\mathbf{A}, \circ, \circ)$  is a two-sided skew brace.

## Opposite skew braces

### Example (Trivial skew brace)

Let  $(\mathbf{A}, \circ)$  be a group, then  $(\mathbf{A}, \circ, \circ)$  is a two-sided skew brace.

### Example (Almost trivial skew brace)

Let  $(\mathbf{A}, \circ)$  be a group, then  $(\mathbf{A}, \circ_{\text{op}}, \circ)$  is a two-sided skew brace.  
Here  $\mathbf{a} \circ_{\text{op}} \mathbf{b} = \mathbf{b} \circ \mathbf{a}$ .

## Opposite skew braces

### Example (Trivial skew brace)

Let  $(\mathbf{A}, \circ)$  be a group, then  $(\mathbf{A}, \circ, \circ)$  is a two-sided skew brace.

### Example (Almost trivial skew brace)

Let  $(\mathbf{A}, \circ)$  be a group, then  $(\mathbf{A}, \circ_{\text{op}}, \circ)$  is a two-sided skew brace.

Here  $\mathbf{a} \circ_{\text{op}} \mathbf{b} = \mathbf{b} \circ \mathbf{a}$ .

In general [KT20]: If  $\mathbf{A} = (\mathbf{A}, +, \circ)$  is a skew brace, then

$\mathbf{A}_{\text{op}} := (\mathbf{A}, +_{\text{op}}, \circ)$  is a skew brace, where  $\mathbf{a} +_{\text{op}} \mathbf{b} = \mathbf{b} + \mathbf{a}$ . We call this the *opposite skew brace* of  $\mathbf{A}$

## Ideals

*Ideals* of a skew brace  $(\mathbf{A}, \cdot, \circ)$  are precisely the sub skew braces  $I$  such that  $(\mathbf{A}/I, \cdot, \circ)$  is well-defined. In particular,  $I$  is a normal subgroup of  $(\mathbf{A}, +)$  and  $(\mathbf{A}, \circ)$ .

\* revisited

Let  $A$  be a skew brace, then  $\mathbf{a * b} := -\mathbf{a} + \mathbf{a} \circ \mathbf{b} - \mathbf{b}$  gives a measure of the difference of  $\mathbf{a} \circ \mathbf{b}$  and  $\mathbf{a} + \mathbf{b}$ :

$$\mathbf{a * b} = \mathbf{0} \iff \mathbf{a} + \mathbf{b} = \mathbf{a} \circ \mathbf{b}.$$

\* revisited

Let  $A$  be a skew brace, then  $\mathbf{a * b} := -\mathbf{a} + \mathbf{a} \circ \mathbf{b} - \mathbf{b}$  gives a measure of the difference of  $\mathbf{a} \circ \mathbf{b}$  and  $\mathbf{a} + \mathbf{b}$ :

$$\mathbf{a * b} = \mathbf{0} \iff \mathbf{a} + \mathbf{b} = \mathbf{a} \circ \mathbf{b}.$$

### Example

Let  $A^2$  be the subgroup of  $(A, +)$  generated by

$$\{\mathbf{a * b} \mid \mathbf{a}, \mathbf{b} \in A\},$$

then  $A^2$  is an ideal of  $A$  and  $A/A^2$  is a trivial skew brace.

\* revisited

Let  $\mathbf{A}$  be a skew brace, then  $\mathbf{a} * \mathbf{b} := -\mathbf{a} + \mathbf{a} \circ \mathbf{b} - \mathbf{b}$  gives a measure of the difference of  $\mathbf{a} \circ \mathbf{b}$  and  $\mathbf{a} + \mathbf{b}$ :

$$\mathbf{a} * \mathbf{b} = \mathbf{0} \iff \mathbf{a} + \mathbf{b} = \mathbf{a} \circ \mathbf{b}.$$

### Example

Let  $\mathbf{A}^2$  be the subgroup of  $(\mathbf{A}, +)$  generated by

$$\{\mathbf{a} * \mathbf{b} \mid \mathbf{a}, \mathbf{b} \in \mathbf{A}\},$$

then  $\mathbf{A}^2$  is an ideal of  $\mathbf{A}$  and  $\mathbf{A}/\mathbf{A}^2$  is a trivial skew brace.

Note that  $\mathbf{A}$  is trivial if and only if  $\mathbf{A}^2 = \mathbf{0}$ .

## Ideals and opposite skew braces

### Proposition

*The ideals of  $\mathbf{A} = (\mathbf{A}, +, \circ)$  and  $\mathbf{A}_{\text{op}} = (\mathbf{A}, +_{\text{op}}, \circ)$  coincide.*

### Example

We can apply the previous example to  $\mathbf{A}_{\text{op}}$  in order to obtain the ideal  $\mathbf{A}_{\text{op}}^2$  of  $\mathbf{A}_{\text{op}}$ , which is the subgroup of  $(\mathbf{A}, +_{\text{op}})$  generated by

$$\{\mathbf{a} *_{\text{op}} \mathbf{b} \mid \mathbf{a}, \mathbf{b} \in \mathbf{A}\},$$

where  $\mathbf{a} *_{\text{op}} \mathbf{b} = -\mathbf{a} +_{\text{op}} \mathbf{a} \circ \mathbf{b} -_{\text{op}} \mathbf{b} = -\mathbf{b} + \mathbf{a} \circ \mathbf{b} - \mathbf{a}$ . In this case  $\mathbf{A}/\mathbf{A}_{\text{op}}^2$  is an almost trivial skew brace.

## Ideals and opposite skew braces

### Proposition

*The ideals of  $\mathbf{A} = (\mathbf{A}, +, \circ)$  and  $\mathbf{A}_{\text{op}} = (\mathbf{A}, +_{\text{op}}, \circ)$  coincide.*

### Example

We can apply the previous example to  $\mathbf{A}_{\text{op}}$  in order to obtain the ideal  $\mathbf{A}_{\text{op}}^2$  of  $\mathbf{A}_{\text{op}}$ , which is the subgroup of  $(\mathbf{A}, +_{\text{op}})$  generated by

$$\{\mathbf{a} *_{\text{op}} \mathbf{b} \mid \mathbf{a}, \mathbf{b} \in \mathbf{A}\},$$

where  $\mathbf{a} *_{\text{op}} \mathbf{b} = -\mathbf{a} +_{\text{op}} \mathbf{a} \circ \mathbf{b} -_{\text{op}} \mathbf{b} = -\mathbf{b} + \mathbf{a} \circ \mathbf{b} - \mathbf{a}$ . In this case  $\mathbf{A}/\mathbf{A}_{\text{op}}^2$  is an almost trivial skew brace.

Note that  $\mathbf{A}$  is an almost trivial skew brace if and only if  $\mathbf{A}_{\text{op}}^2 = \mathbf{0}$ .

## Two-sided skew braces

Let  $A$  be a two-sided skew brace. Then for all  $a, b, c, d \in A$ ,

$$\begin{aligned}(a + b) \circ (c + d) &= (a + b) \circ c - (a + b) + (a + b) \circ d \\ &= a \circ c - c + b \circ c - b - a + a \circ d - d + b \circ d \\ &= a \circ c + b *_{\text{op}} c + a * d + b \circ d\end{aligned}$$

## Two-sided skew braces

Let  $A$  be a two-sided skew brace. Then for all  $a, b, c, d \in A$ ,

$$\begin{aligned}(a + b) \circ (c + d) &= (a + b) \circ c - (a + b) + (a + b) \circ d \\ &= a \circ c - c + b \circ c - b - a + a \circ d - d + b \circ d \\ &= a \circ c + b *_{\text{op}} c + a * d + b \circ d\end{aligned}$$

but also

$$\begin{aligned}(a + b) \circ (c + d) &= a \circ (c + d) - (c + d) + b \circ (c + d) \\ &= a \circ c - a + a \circ d - d - c + b \circ c - b + b \circ d \\ &= a \circ c + a * d + b *_{\text{op}} c + b \circ d.\end{aligned}$$

## Two-sided skew braces

Hence  $b *_{\text{op}} c + a * d = a * d + b *_{\text{op}} c$ , therefore

### Proposition ([T22])

*Let  $A$  be a two-sided skew brace, then  $A^2$  centralizes  $A_{\text{op}}^2$  in  $(A, +)$ .*

### Theorem ([T22])

*Let  $A$  be a two-sided skew brace, then  $(A^2 \cap A_{\text{op}}^2, +)$  is abelian, so  $A^2 \cap A_{\text{op}}^2$  is a two-sided brace.*

Natural question: what can we say about  $A/(A^2 \cap A_{\text{op}}^2)$ ?

## Weakly trivial skew braces

### Definition

A skew brace  $A$  is called *weakly trivial* if  $A^2 \cap A_{\text{op}}^2 = 0$ .

## Weakly trivial skew braces

### Definition

A skew brace  $\mathbf{A}$  is called *weakly trivial* if  $\mathbf{A}^2 \cap \mathbf{A}_{\text{op}}^2 = \mathbf{0}$ .

### Lemma ([T22])

*Every weakly trivial skew brace is two-sided.*

## Weakly trivial skew braces

### Definition

A skew brace  $\mathbf{A}$  is called *weakly trivial* if  $\mathbf{A}^2 \cap \mathbf{A}_{\text{op}}^2 = \mathbf{0}$ .

### Lemma ([T22])

*Every weakly trivial skew brace is two-sided.*

### Lemma ([T22])

*Let  $\mathbf{A}$  be a skew brace, then  $\mathbf{A}/(\mathbf{A}^2 \cap \mathbf{A}_{\text{op}}^2)$  is a weakly trivial skew brace.*

## Weakly trivial skew braces

### Definition

A skew brace  $\mathbf{A}$  is called *weakly trivial* if  $\mathbf{A}^2 \cap \mathbf{A}_{\text{op}}^2 = \mathbf{0}$ .

### Lemma ([T22])

*Every weakly trivial skew brace is two-sided.*

### Lemma ([T22])

*Let  $\mathbf{A}$  be a skew brace, then  $\mathbf{A}/(\mathbf{A}^2 \cap \mathbf{A}_{\text{op}}^2)$  is a weakly trivial skew brace.*

### Proposition ([T22])

*Every two-sided skew brace is an extensions of a weakly trivial skew brace by a two-sided brace.*

## Weakly trivial skew braces

### Example

- ▶ Trivial and almost trivial skew braces are weakly trivial.
- ▶ Direct products and sub skew braces of weakly trivial skew braces are weakly trivial.

## Weakly trivial skew braces

### Example

- ▶ Trivial and almost trivial skew braces are weakly trivial.
- ▶ Direct products and sub skew braces of weakly trivial skew braces are weakly trivial.

### Proposition ([T22])

*A weakly trivial skew brace embeds into a direct product of a trivial and almost trivial skew brace, more precisely*

$$\iota : A \rightarrow A/A^2 \times A/A_{\text{op}}^2, \quad a \mapsto (a + A^2, a + A_{\text{op}}^2).$$

## Properties of trivial and almost trivial skew braces

Let  $A$  be a trivial or almost trivial skew brace.

1. A quotient of a trivial, respectively almost trivial, skew brace is trivial, respectively almost trivial.

## Properties of trivial and almost trivial skew braces

Let  $\mathbf{A}$  be a trivial or almost trivial skew brace.

1. A quotient of a trivial, respectively almost trivial, skew brace is trivial, respectively almost trivial.
2. It is true that  $(\mathbf{A}, +) \cong (\mathbf{A}, \circ)$ .

## Properties of trivial and almost trivial skew braces

Let  $\mathbf{A}$  be a trivial or almost trivial skew brace.

1. A quotient of a trivial, respectively almost trivial, skew brace is trivial, respectively almost trivial.
2. It is true that  $(\mathbf{A}, +) \cong (\mathbf{A}, \circ)$ .
3. The nilpotency classes of  $(\mathbf{A}, +)$  and  $(\mathbf{A}, \circ)$  coincide. The same holds for solvability.

## Properties of weakly trivial skew braces

Let  $\mathbf{A}$  be a weakly trivial skew brace.

1. It is not true that any quotient of  $\mathbf{A}$  is weakly trivial.

## Properties of weakly trivial skew braces

Let  $\mathbf{A}$  be a weakly trivial skew brace.

1. It is not true that any quotient of  $\mathbf{A}$  is weakly trivial.
2. It is not true that  $(\mathbf{A}, +) \cong (\mathbf{A}, \circ)$ , the smallest counterexample has order 100.

## Properties of weakly trivial skew braces

Let  $\mathbf{A}$  be a weakly trivial skew brace.

1. It is not true that any quotient of  $\mathbf{A}$  is weakly trivial.
2. It is not true that  $(\mathbf{A}, +) \cong (\mathbf{A}, \circ)$ , the smallest counterexample has order 100.
3. The nilpotency classes of  $(\mathbf{A}, +)$  and  $(\mathbf{A}, \circ)$  coincide. The same holds for solvability.

## Consequences: simple two-sided skew braces

### Definition

A skew brace  $\mathbf{A}$  is *simple* if it contains no nontrivial ideals.

### Theorem ([T22])

Let  $\mathbf{A}$  be a simple two-sided skew brace, then one of the following holds:

1.  $\mathbf{A} \cong (\mathbf{G}, \circ, \circ)$  with  $(\mathbf{G}, \circ)$  a simple group,
2.  $\mathbf{A} \cong (\mathbf{G}, \circ_{\text{op}}, \circ)$  with  $(\mathbf{G}, \circ)$  a simple group,
3.  $\mathbf{A}$  is an infinite two-sided brace.

Consequences: connections  $(A, +)$  and  $(A, \circ)$

### Theorem ([T22])

*Let  $A$  be a two-sided skew brace and  $(A, \circ)$  solvable of degree  $n$ , then  $(A, +)$  is solvable of degree at most  $n + 1$ .*

Consequences: connections  $(A, +)$  and  $(A, \circ)$

### Theorem ([T22])

*Let  $A$  be a two-sided skew brace and  $(A, \circ)$  solvable of degree  $n$ , then  $(A, +)$  is solvable of degree at most  $n + 1$ .*

For general skew braces the implication

$$(A, \circ) \text{ solvable} \implies (A, +) \text{ solvable}$$

does not hold!

Consequences: connections  $(A, +)$  and  $(A, \circ)$

### Conjecture (Byott)

*Let  $A$  be a finite skew brace, if  $(A, +)$  is solvable then also  $(A, \circ)$  is solvable.*

Consequences: connections  $(A, +)$  and  $(A, \circ)$

### Conjecture (Byott)

*Let  $A$  be a finite skew brace, if  $(A, +)$  is solvable then also  $(A, \circ)$  is solvable.*

### Theorem ([Nas19])

*Byott's conjecture holds for two-sided skew braces.*

Consequences: connections  $(A, +)$  and  $(A, \circ)$

### Conjecture (Byott)

*Let  $A$  be a finite skew brace, if  $(A, +)$  is solvable then also  $(A, \circ)$  is solvable.*

### Theorem ([Nas19])

*Byott's conjecture holds for two-sided skew braces.*

Is finiteness necessary?

Consequences: connections  $(A, +)$  and  $(A, \circ)$

Theorem ([T22, Wat68])

*Let  $A$  be a two-sided skew brace, then  $(A, +)$  satisfies the ACC on subgroups if and only if  $(A, \circ)$  satisfies the ACC on subgroups.*

Consequences: connections  $(\mathbf{A}, +)$  and  $(\mathbf{A}, \circ)$

Theorem ([T22, Wat68])

*Let  $\mathbf{A}$  be a two-sided skew brace, then  $(\mathbf{A}, +)$  satisfies the ACC on subgroups if and only if  $(\mathbf{A}, \circ)$  satisfies the ACC on subgroups.*

Theorem ([T22])

*Let  $\mathbf{A}$  be a two-sided skew brace satisfying the equivalent conditions of the previous theorem, then  $(\mathbf{A}, +)$  is solvable if and only if  $(\mathbf{A}, \circ)$  is solvable.*
