

Two volumes 184 and 188 of “Fundamenta Mathematicae” consisted of papers submitted by the participants of the conference “Knots in Poland 2003”. However, this did not cover all the valuable contributions made on this occasion. For this reason the Editorial Board of “Fundamenta” decided to collect the remaining accepted papers in this third separate volume. For the benefit of the readers, at the end of the volume we give the tables of contents of volumes 184 and 188.

Similarly to the two earlier ones, the present volume is devoted to knot theory and low-dimensional topology and has been edited by Józef H. Przytycki and by the Guest Editors, Vaughan F. R. Jones, Vladimir Turaev and Bronisław Wajnryb.
