PROBABILITY THAT AN ELEMENT OF A FINITE GROUP HAS A SQUARE ROOT

BY

M. S. LUCIDO (Udine) and M. R. POURNAKI (Tehran)

Abstract. Let G be a finite group of even order. We give some bounds for the probability $\mathrm{p}(G)$ that a randomly chosen element in G has a square root. In particular, we prove that $\mathrm{p}(G) \le 1 - \lfloor\sqrt{|G|}\rfloor/|G|$. Moreover, we show that if the Sylow 2-subgroup of G is not a proper normal elementary abelian subgroup of G, then $\mathrm{p}(G) \le 1 - 1/\sqrt{|G|}$. Both of these bounds are best possible upper bounds for $\mathrm{p}(G)$, depending only on the order of G.

1. Introduction. Let G be a finite group and let $g \in G$. If there exists an element $h \in G$ for which $g = h^2$, then we say that g has a *square root*. Clearly, g may have one or more square roots, or it may have none. Let G^2 be the set of all elements of G which have at least one square root, i.e.,

$$G^2 = \{g \in G \mid \text{there exists } h \in G \text{ such that } g = h^2\},$$

or simply $G^2 = \{g^2 \mid g \in G\}$. Then

$$\mathrm{p}(G) = \frac{|G^2|}{|G|}$$

is the probability that a randomly chosen element in G has a square root.

The properties of $\mathrm{p}(S_n)$, where S_n denotes the symmetric group on n letters, have been studied by some authors. Asymptotic properties of $\mathrm{p}(S_n)$ were studied in [1], [2], [8] and in [3], which is devoted to the proof of a conjecture of Wilf [9] that $\mathrm{p}(S_n)$ is non-increasing in n. Recently, the basic properties of $\mathrm{p}(G)$ for an arbitrary finite group G have been studied by the authors of this paper (see [7]). Moreover, they calculated $\mathrm{p}(G)$ when G is a simple group of Lie type of rank 1 or when G is an alternating group. A table of $\mathrm{p}(G)$ for the sporadic finite simple groups was also given.

In this paper we give some bounds for the probability that a randomly chosen element in a given finite group has a square root. In particular, we

Research of the second author supported in part by grant no. 83200112 from IPM.

give the following best possible upper bounds for $\mathrm{p}(G)$, depending only on $|G|$ (see Theorems 2.11 and 2.13).

MAIN THEOREM. *Let G be a finite group of even order. Then*

$$\mathrm{p}(G) \leq 1 - \lfloor\sqrt{|G|}\rfloor/|G|.$$

Moreover, if the Sylow 2-subgroup of G is not a proper normal elementary abelian subgroup of G, then $\mathrm{p}(G) \leq 1 - 1/\sqrt{|G|}$, and both bounds are the best possible.

2. The best possible bounds. By [7, Proposition 2.1(ii)], $\mathrm{p}(G) = 1$ if and only if $|G|$ is odd. Therefore we deal with even order groups. The following theorem presents an upper bound for $\mathrm{p}(G)$ when G has even order, improving the bound $\mathrm{p}(G) < 1$.

THEOREM 2.1. *Let G be a finite group of even order, and P be a Sylow 2-subgroup of G. Then $\mathrm{p}(G) \leq 1 - 1/|P|$.*

Let P be the additive group of the field $\mathrm{GF}(2^n)$ and let $H = \mathrm{GF}(2^n)^\times$ be its multiplicative group. Let $G = PH$ be the semidirect product of these groups, with H acting on P by multiplication. Then $\mathrm{p}(G) = 1 - 1/|P|$, which shows that the bound in Theorem 2.1 is sharp.

The following corollary is just a combination of Theorem 2.1 and Proposition 2.3 of [7].

COROLLARY 2.2. *Let G be a finite group of even order, and P be a Sylow 2-subgroup of G. If G is solvable, then $1/|P| \leq \mathrm{p}(G) \leq 1 - 1/|P|$.*

We recall that if a Sylow 2-subgroup of a finite group is cyclic, then the group has a normal 2-complement (see for example [6, 7.2.2]), and it is therefore solvable. We thus get the following corollary.

COROLLARY 2.3. *Let G be a finite group such that $|G| = 2m$, where m is odd. Then $\mathrm{p}(G) = 1/2$.*

In order to prove Theorem 2.1, we must first explain a few things about decomposition of an element in a finite group. So let G be a finite group. We can uniquely decompose each element $x \in G$ into $x = x_2 x_{2'} = x_{2'} x_2$, where x_2 is a 2-element of G and $x_{2'}$ is an element of G of odd order. Moreover, if x has a square root then so also does x_2. In the following, when we speak about x_2 and $x_{2'}$, we always mean this unique decomposition of x. We also need the following result originally proved by Frobenius (see [5] and also Corollary 41.11 of [4] as a more accessible reference).

REMARK 2.4. Let G be a finite group, $a \in G$, and n be a positive integer. Then the number of solutions of the equation $x^n = a$ in G is a multiple of $\gcd(n, |C_G(a)|)$. In particular, the number of solutions of the equation $x^n = 1$ in G is a multiple of $\gcd(n, |G|)$.

Proof of Theorem 2.1. Choose $a \in G$ such that a is a 2-element of maximal order in G. We claim that if $x \in G$ and $x = x_2 x_{2'}$ with x_2 a conjugate of a, then x does not have a square root. To prove the claim, suppose that $a = h^2$ for some $h \in G$. Then by [7, Remark 2.2] we have $|h| = 2|a|$, which contradicts the definition of a. Therefore a does not have a square root and the same is true for its conjugates. Hence, x_2 does not have a square root, which in turn implies that x does not have a square root. Therefore the claim holds and we have

$$\{x \in G \mid x_2 \text{ is conjugate to } a\} \subseteq G \setminus G^2.$$

Observe also that the number of $x \in G$ for which x_2 is conjugate to a is equal to $|G : C_G(a)|t$, where t is the number of elements of odd order of $C_G(a)$. Therefore

$$|G : C_G(a)|t \leq |G| - |G^2|.$$

We now write $|G| = 2^k m$ where $k \geq 1$ and m is odd. Then it is clear that $|C_G(a)| = 2^{k'} m'$ for some positive integers k' and m' such that $k' \leq k$ and $m' \mid m$. On the other hand, it is easy to see that an element x in $C_G(a)$ has odd order if and only if $x^{m'} = 1$. Therefore, t is equal to the number of solutions of the equation $x^{m'} = 1$ in $C_G(a)$. By Remark 2.4, this is a multiple of $\gcd(m', 2^{k'} m') = m'$. Hence, $m' \leq t$ and thus $|G : C_G(a)|m' \leq |G : C_G(a)|t \leq |G| - |G^2|$. By dividing both sides by $|G|$ we obtain

$$\frac{m'}{|C_G(a)|} \leq 1 - \mathrm{p}(G),$$

which in turn implies that

$$\mathrm{p}(G) \leq 1 - \frac{m'}{2^{k'} m'} = 1 - \frac{1}{2^{k'}} \leq 1 - \frac{1}{2^k} = 1 - \frac{1}{|P|},$$

as required. ■

The following theorem gives another upper bound for $\mathrm{p}(G)$ when G has even order, depending only on the order of G and the number of 2-elements of G.

THEOREM 2.5. *Let G be a finite group of even order, and denote by Q the set of 2-elements of G. Then $\mathrm{p}(G) \leq 1 - |Q|/2|G|$.*

Proof. Suppose $a \in Q$. By Remark 2.4, the number of solutions of the equation $x^2 = a$ in G is a multiple of $\gcd(2, |C_G(a)|)$. Hence, this number is either 0 or ≥ 2. But by [7, Remark 2.2] all solutions of this equation lie in Q. Therefore, $|G| - |G^2| \geq |Q|/2$, or $\mathrm{p}(G) \leq 1 - |Q|/2|G|$ as required. ■

We now prove an easy but useful lemma.

LEMMA 2.6. *Let G be a finite group, and N be a normal subgroup of G. Then $\mathrm{p}(G) \leq \mathrm{p}(G/N)$.*

Proof. Note that $gN \in G/N$ has a square root if and only if there is $xN \in G/N$ for which $gN = (xN)^2$ if and only if $x^2 \in gN$. Therefore, $gN \in G/N$ does not have a square root if and only if there is no element $x \in G$ with $x^2 \in gN$. Hence, if a coset in G/N does not have a square root, then no element of this coset has a square root in G, and therefore $|G| - |G^2| \geq |N|(|G/N| - |(G/N)^2|)$. By dividing both sides by $|G|$ we obtain $1 - \mathrm{p}(G) \geq 1 - \mathrm{p}(G/N)$, or $\mathrm{p}(G) \leq \mathrm{p}(G/N)$ as required. ∎

As corollaries of Lemma 2.6, we give an upper bound for $\mathrm{p}(G)$ when G is a finite 2-group, depending only on the order of $|G|$, and then an upper bound for $\mathrm{p}(G)$ when G is a finite nilpotent group.

Corollary 2.7. *Let G be a finite 2-group such that $|G| \geq 4$. Then $\mathrm{p}(G) \leq 1 - 1/\sqrt{|G|}$.*

Proof. Suppose that $\Phi(G)$ is the Frattini subgroup of G. By Lemma 2.6 and Theorem 2.4(i) of [7], we have

$$\mathrm{p}(G) \leq \mathrm{p}\left(\frac{G}{\Phi(G)}\right) = \frac{1}{|G/\Phi(G)|} \leq \frac{1}{2}.$$

Since $|G| \geq 4$, we obtain $1/2 \leq 1 - 1/\sqrt{|G|}$, and so the above inequality implies that $\mathrm{p}(G) \leq 1 - 1/\sqrt{|G|}$ as required. ∎

Corollary 2.8. *Let G be a finite nilpotent group of even order, and P be a Sylow 2-subgroup of G. If $|P| = 2$, then $\mathrm{p}(G) = 1/2$. If $|P| > 2$, then $1/|P| \leq \mathrm{p}(G) \leq 1 - 1/\sqrt{|P|} \leq 1 - 1/\sqrt{|G|}$.*

Proof. The first statement is Corollary 2.3. The second statement comes from Corollary 2.7 and Proposition 2.3 of [7], which states that if G is nilpotent, then $\mathrm{p}(G) = \mathrm{p}(P)$. ∎

The following two propositions give upper bounds for $\mathrm{p}(G)$, depending on the order of G, but only for special classes of even order groups.

Proposition 2.9. *Let G be a finite group of even order. If G contains more than one Sylow 2-subgroup, then $\mathrm{p}(G) \leq 1 - 1/\sqrt{|G|}$.*

Proof. Let P be a Sylow 2-subgroup of G. Since G has at least two distinct Sylow 2-subgroups, P is not normal in G. By Remark 2.4, the number of solutions of the equation $x^{|P|} = 1$ in G is a multiple of $\gcd(|P|, |G|) = |P|$. Therefore, $|P|$ divides the number of solutions of $x^{|P|} = 1$ in G. But if we let Q be the set of 2-elements of G, then the set of solutions of the equation $x^{|P|} = 1$ in G is just Q, and this means $|P|$ divides $|Q|$. Hence, either $|P| = |Q|$ or $|P| \leq |Q|/2$. In the first case $P = Q$ is normal in G, contrary to hypothesis. Hence, $|P| \leq |Q|/2$. On the other hand, by Theorem 2.5, we have $\mathrm{p}(G) \leq 1 - |Q|/2|G|$, and so $\mathrm{p}(G) \leq 1 - |P|/|G|$. This inequality together with Theorem 2.1 now implies that $(1-\mathrm{p}(G))^2 \geq (|P|/|G|)(1/|P|) = 1/|G|$, and so $\mathrm{p}(G) \leq 1 - 1/\sqrt{|G|}$ as required. ∎

PROPOSITION 2.10. *Let G be a finite group of even order with elementary abelian Sylow 2-subgroups. Then* $\mathrm{p}(G) \leq 1 - \lfloor\sqrt{|G|}\rfloor/|G|$.

Proof. Suppose P is an elementary abelian Sylow 2-subgroup of G. Consider $x \neq 1$ as an element of P. If there is $y \in G$ such that $x = y^2$, then by [7, Remark 2.2] we have $|y| = 4$, which is a contradiction. Therefore, $x \in G \setminus G^2$, and so $P \setminus \{1\} \subseteq G \setminus G^2$. Hence, $|P| - 1 \leq |G| - |G^2|$. On the other hand, by Theorem 2.1, $\mathrm{p}(G) \leq 1 - 1/|P|$ and so $|G^2| \leq |G| - |G|/|P|$, which implies $|G|/|P| \leq |G| - |G^2|$. Therefore, $|G| - |G|/|P| \leq (|G| - |G^2|)^2$, or

$$|G| \leq (|G|-|G^2|)^2+|G|/|P| \leq (|G|-|G^2|)(|G|-|G^2|+1) < (|G|-|G^2|+1)^2.$$

This implies that $\sqrt{|G|} < |G| - |G^2| + 1$, so $\lfloor\sqrt{|G|}\rfloor \leq |G| - |G^2|$, and hence $\mathrm{p}(G) \leq 1 - \lfloor\sqrt{|G|}\rfloor/|G|$ as required. ∎

The bound of Proposition 2.10 is the best possible. In fact, if G is the group described just after the statement of Theorem 2.1, then $\mathrm{p}(G) = 1 - \lfloor\sqrt{|G|}\rfloor/|G|$.

We can now state the following theorem which gives lower and upper bounds for $\mathrm{p}(G)$, depending only on the order of G.

THEOREM 2.11. *Let G be a finite group of even order. Then*

$$1/|G| \leq \mathrm{p}(G) \leq 1 - \lfloor\sqrt{|G|}\rfloor/|G|.$$

Proof. It is clear that $1/|G| \leq \mathrm{p}(G)$ (see also Proposition 2.1 of [7]). Therefore we prove the second inequality. We first consider groups G with $|G| < 26$. Among these, by Corollary 2.3, we only need to deal with groups whose order is divisible by 4. Moreover, if G is nilpotent, then by Proposition 2.3 of [7] and by Corollary 2.7, we have

$$\mathrm{p}(G) = \mathrm{p}(P) \leq 1 - \frac{1}{\sqrt{|P|}} \leq 1 - \frac{1}{\sqrt{|G|}} \leq 1 - \frac{\lfloor\sqrt{|G|}\rfloor}{|G|},$$

and we are done. Therefore we should prove the second inequality only for groups of order 12, 20 and 24. In these cases, if the Sylow 2-subgroup is normal, we are done, and otherwise we can use Proposition 2.9. Hence, the second inequality holds for groups G with $|G| < 26$.

We now suppose that $|G| \geq 26$. Let $N \neq 1$ be a minimal normal subgroup of G.

Suppose that G/N has odd order. In this case $|N|$ is even. Since N is minimal normal, it is isomorphic to a direct product of isomorphic simple groups. There are two possibilities. If $N \cong \mathbb{Z}_2 \times \cdots \times \mathbb{Z}_2$ is an elementary abelian 2-group, then N is the unique Sylow 2-subgroup of G. Hence, Proposition 2.10 implies that $\mathrm{p}(G) \leq 1 - \lfloor\sqrt{|G|}\rfloor/|G|$, which gives the second inequality. If $N \cong S \times \cdots \times S$, where S is a non-abelian simple group, then G has at least two distinct Sylow 2-subgroups and so, by Proposition 2.9, we obtain $\mathrm{p}(G) \leq 1 - 1/\sqrt{|G|} \leq 1 - \lfloor\sqrt{|G|}\rfloor/|G|$, which gives the second inequality.

Next we assume that G/N has even order. In this case, we apply induction on $|G|$. Since $|G/N| < |G|$, the inductive hypothesis implies that

$$\mathrm{p}(G/N) \leq 1 - \frac{\lfloor\sqrt{|G/N|}\rfloor}{|G/N|}, \tag{1}$$

and therefore, by Lemma 2.6, we have

$$\mathrm{p}(G) \leq 1 - \frac{\lfloor\sqrt{|G/N|}\rfloor}{|G/N|}. \tag{2}$$

We claim that if $|N| \geq 12$, then

$$1 - \frac{\lfloor\sqrt{|G/N|}\rfloor}{|G/N|} \leq 1 - \frac{\lfloor\sqrt{|G|}\rfloor}{|G|}. \tag{3}$$

To prove the claim, observe that (3) is equivalent to $\lfloor\sqrt{|G|}\rfloor \leq \lfloor\sqrt{|G/N|}\rfloor|N|$. Therefore it is enough to prove that $\sqrt{|G|} \leq (\sqrt{|G/N|} - 1)|N|$, that is, $\sqrt{|G|} \geq |N|/(\sqrt{|N|}-1)$. Since $|G| \geq 2|N|$, it is sufficient to show that $\sqrt{2} \geq \sqrt{|N|}/(\sqrt{|N|}-1)$, which is true for $|N| \geq 12$. Therefore the claim holds and so for $|N| \geq 12$ we get, using (2), the inequality $\mathrm{p}(G) \leq 1 - \lfloor\sqrt{|G|}\rfloor/|G|$, which is the second inequality.

We now suppose that $|N| \leq 11$. We observe that (1) is equivalent to

$$|G/N| - |(G/N)^2| \geq \lfloor\sqrt{|G/N|}\rfloor.$$

Therefore there are at least $\lfloor\sqrt{|G/N|}\rfloor$ cosets $g_1N, \ldots, g_lN$ such that there is no $x \in G$ with $x^2 \in g_iN$, $i = 1, \ldots, l$. Consequently,

$$|G| - |G^2| \geq |N|\lfloor\sqrt{|G/N|}\rfloor. \tag{4}$$

For any N such that $1 < |N| \leq 11$, it is easy to prove that

$$\frac{|N|}{\sqrt{|N|} - 1} < 5.$$

Since $|G| \geq 26$, we have $\sqrt{|G|} > 5$, therefore

$$\frac{|N|}{\sqrt{|N|} - 1} < 5 < \sqrt{|G|}.$$

This implies that $|N| < \sqrt{|G|}(\sqrt{|N|} - 1)$, which can be rewritten as

$$0 < \sqrt{|G|}\sqrt{|N|} - \sqrt{|G|} - |N|,$$

or

$$0 < \sqrt{|N|}(\sqrt{|G|} - \sqrt{|N|}) - \sqrt{|G|}.$$

So we have

$$\sqrt{|G|} < |N|(\sqrt{|G/N|} - 1) < |N|\lfloor\sqrt{|G/N|}\rfloor.$$

Since $\lfloor\sqrt{|G|}\rfloor \leq \sqrt{|G|}$, using (4) we get $\lfloor\sqrt{|G|}\rfloor \leq |G| - |G|^2$, which gives $\mathrm{p}(G) \leq 1 - \lfloor\sqrt{|G|}\rfloor/|G|$. ■

The cyclic group of order 4 shows that the bound in Theorem 2.11 is the best possible. In fact,

$$\mathrm{p}(\mathbb{Z}_4) = 1/2 = 1 - 1/\sqrt{4}.$$

A natural question arises: *Does the slightly stronger bound of Proposition* 2.9 *hold if P is normal but $\Phi(P) > 1$, so that only elementary abelian normal Sylow* 2*-subgroups are responsible for the weaker bound of Theorem* 2.11*?*

The answer is yes, as we prove in the following theorem.

THEOREM 2.12. *Let G be a finite group of even order*, *and P be a Sylow* 2*-subgroup of G. If* $\mathrm{p}(G) > 1-1/\sqrt{|G|}$, *then P is a proper normal elementary abelian subgroup of G.*

Proof. By Proposition 2.9, P is normal, and by Corollary 2.8, G is not nilpotent and therefore $P \neq G$. Let $\Phi = \Phi(P)$ be the Frattini subgroup of P. We first suppose that $\sqrt{|G|} \leq |P|/2$. Then $1/\sqrt{|G|} \leq |P|/2|G|$, which implies, by Theorem 2.5,

$$\mathrm{p}(G) \leq 1 - \frac{|P|}{2|G|} \leq 1 - \frac{1}{\sqrt{|G|}},$$

contrary to hypothesis.

Therefore we can suppose that $|\Phi|^2 \leq |P|^2/4 \leq |G|$. Then, by Lemma 2.6 and Theorem 2.11, we have

$$\mathrm{p}(G) \leq \mathrm{p}(G/\Phi) \leq 1 - \frac{\lfloor\sqrt{|G/\Phi|}\rfloor}{|G/\Phi|} \leq 1 - \frac{|\Phi|(\sqrt{|G/\Phi|} - 1)}{|G|}.$$

We want to prove that

$$\frac{|\Phi|(\sqrt{|G/\Phi|} - 1)}{|G|} \geq \frac{1}{\sqrt{|G|}}.$$

This is equivalent to showing that

$$\sqrt{|G|} \geq \frac{|\Phi|}{\sqrt{|\Phi|} - 1}. \tag{5}$$

We first suppose that $|\Phi| \geq 4$; then $\sqrt{|\Phi|} - 1 \geq 1$ and the inequality (5) is equivalent to $|\Phi|^2 \leq |G|$, which we are assuming is true.

We then suppose $|\Phi| = 2$. If P is cyclic, then by the remark preceding Corollary 2.3, P has a normal 2-complement Q. Hence $G = P \times Q$ and by Corollary 2.7,

$$\begin{aligned} \mathrm{p}(G) &= \mathrm{p}(P \times Q) = \mathrm{p}(P)\mathrm{p}(Q) = \mathrm{p}(P) \\ &\leq 1 - \frac{1}{\sqrt{|P|}} \leq 1 - \frac{1}{\sqrt{|G|}}, \end{aligned}$$

contrary to hypothesis. Thus P is not cyclic, and this implies $|P| \geq 8$ and $|G| \geq 24$, so again

$$\sqrt{G} \geq \sqrt{24} > \frac{2}{\sqrt{2} - 1} = \frac{|\Phi|}{\sqrt{|\Phi|} - 1},$$

which is (5).

Thus (5) holds in both cases, and this implies $\mathrm{p}(G) \leq 1 - 1/\sqrt{G}$, contrary to hypothesis. This last contradiction proves that $\Phi = \{1\}$. ■

We close this section by observing that Theorems 2.11 and 2.12 together prove the following theorem. Moreover, the group G described just after the statement of Theorem 2.1 shows that the bound $\mathrm{p}(G) \leq 1 - \lfloor\sqrt{|G|}\rfloor/|G|$ in Theorem 2.11 is the best possible and the cyclic group of order 4 shows that the better bound $\mathrm{p}(G) \leq 1 - 1/\sqrt{G}$ is again the best possible.

THEOREM 2.13. *Let G be a finite group of even order. If the Sylow 2-subgroup of G is not a proper normal elementary abelian subgroup of G, then*

$$\mathrm{p}(G) \leq 1 - 1/\sqrt{G}.$$
