

*3-WEAK AMENABILITY OF  $(2n)$ TH DUALS OF  
BANACH ALGEBRAS*

BY

MINA ETTEFAGH (Tabriz)

**Abstract.** We show that under some conditions, 3-weak amenability of the  $(2n)$ th dual of a Banach algebra  $A$  for some  $n \geq 1$  implies 3-weak amenability of  $A$ .

**1. Introduction and preliminaries.** Throughout this paper,  $A$  is a Banach algebra, and  $A', A'', \dots, A^{(n)}$  denote the iterated duals of  $A$ . We always use the first Arens product on  $A^{(2n)}$  ( $n \geq 1$ ), denoted by  $\square$ . We regard  $A$  as a subalgebra of  $A''$  by the canonical embedding  $i : A \rightarrow A''$  ( $a \mapsto \hat{a}$ ) where  $\langle \hat{a}, f \rangle = \langle f, a \rangle$  for  $f \in A'$ . We recall that  $A'$  is a Banach  $A$ -bimodule under the actions

$$\langle a.f, b \rangle = \langle f, ba \rangle, \quad \langle f.a, b \rangle = \langle f, ab \rangle \quad (a, b \in A, f \in A').$$

Also let  $E$  be a Banach  $A$ -bimodule. Then  $E''$  is a Banach  $A''$ -bimodule under the actions

$$(1.1) \quad F.A = w^*\text{-}\lim_i w^*\text{-}\lim_j \widehat{a_i x_j}, \quad A.F = w^*\text{-}\lim_j w^*\text{-}\lim_i \widehat{x_j a_i}$$

where  $F = w^*\text{-}\lim_i \widehat{a_i}$  and  $A = w^*\text{-}\lim_j \widehat{x_j}$  are such that  $(a_i) \subset A$  and  $(x_j) \subset E$  are bounded nets, and the limits are in the weak\* topology.

In Section 2 we investigate two  $A''$ -bimodule structures on  $A^{(5)}$  given by  $A^{(5)} = (((A')')'')''$  and  $A^{(5)} = (((A'')')')'$ , and also two  $A^{(4)}$ -bimodule structures on  $A^{(7)} = (((((A')')')'')'')''$  and  $A^{(7)} = (((((A'')'')')')')')'$ . In a similar work [6] we investigated two  $A''$ -bimodule structures on  $A^{(3)} = (A')''$  and  $A^{(3)} = (A'')'$ .

For a Banach  $A$ -bimodule  $E$ , a continuous linear map  $D : A \rightarrow E$  is called a *derivation* if

$$D(ab) = a.D(b) + D(a).b \quad (a, b \in A).$$

For  $x \in E$  the derivation  $\delta_x : A \rightarrow E$  defined by  $\delta_x(a) = ax - xa$  is called an *inner derivation*. The Banach algebra  $A$  is called *amenable* if every derivation  $D : A \rightarrow E'$  is inner, for each Banach  $A$ -bimodule  $E$  (see [8]). If

2010 *Mathematics Subject Classification*: Primary 46H25.

*Key words and phrases*: Banach algebra, Banach bimodule, Arens regularity,  $n$ -weak amenability.

every derivation  $D : A \rightarrow A'$  [ $D : A \rightarrow A^{(n)}$ ,  $n \in \mathbb{N}$ ] is inner, then  $A$  is called *weakly amenable* [*n-weakly amenable*]; see also [1, 4] for details.

**THEOREM 1.1** ([3, Theorem 2.7.17]). *Let  $A$  be a Banach algebra,  $E$  a Banach  $A$ -bimodule and  $D : A \rightarrow E$  a continuous derivation. Then  $D'' : A'' \rightarrow E''$  is a continuous derivation.*

**REMARK 1.2.** In the above theorem, the  $A''$ -bimodule structure on  $E''$  is as in (1.1).

It is known that every  $(n + 2)$ -weakly amenable Banach algebra is  $n$ -weakly amenable for  $n \geq 1$  (see [4]). Also it was shown in [7] that if  $A''$  is  $n$ -weakly amenable and  $A$  is a dual Banach algebra, then  $A$  is  $n$ -weakly amenable. In [9] it was shown that if  $A$  is complete Arens regular and every derivation  $D : A \rightarrow A'$  is weakly compact, then weak amenability of  $A^{(2n)}$  for some  $n \geq 1$  implies weak amenability of  $A$ . Recently in [2] the authors determined conditions guaranteeing that 3-weak amenability of  $A''$  implies 3-weak amenability of  $A$ .

In this paper we introduce conditions implying that 3-weak amenability of  $A^{(2n)}$  for some  $n \geq 1$  implies 3-weak amenability of  $A$ , and hence weak amenability of  $A$ . We find these conditions by studying  $A^{(2n)}$ -module structures on  $A^{(2n+3)}$  in Section 2, and then apply them in Section 3.

**2.  $A^{(2n)}$ -bimodule structures on  $A^{(2n+3)}$ .** First we consider the  $A''$ -bimodule structures on  $A^{(5)} = (((A')')'')''$  and  $A^{(5)} = (((A'')'')')'$  and then the  $A^{(4)}$ -bimodule structures on  $A^{(7)} = (((A')')'')''$  and  $A^{(7)} = (((A'')'')'')'$ . The results can be extended to  $A^{(2n)}$ -bimodule structures on  $A^{(2n+3)}$ .

Take  $a^{(5)} \in A^{(5)}$ ,  $a^{(4)} \in A^{(4)}$ , and  $a'' \in A''$  with bounded nets  $(a'''_\alpha) \subset A'''$ ,  $(a''_i) \subset A''$ , and  $(a_\beta) \subset A$  such that  $a^{(5)} = w^*\text{-}\lim_\alpha \widehat{a'''_\alpha}$ ,  $a^{(4)} = w^*\text{-}\lim_i \widehat{a''_i}$ , and  $a'' = w^*\text{-}\lim_\beta \widehat{a_\beta}$ .

For the  $A''$ -bimodule structure on  $A^{(5)} = (((A')')'')''$  we have

$$(2.1) \quad \begin{aligned} \langle a'' \cdot a^{(5)}, a^{(4)} \rangle &= \lim_\beta \lim_\alpha \langle a^{(4)}, a_\beta \cdot a'''_\alpha \rangle = \lim_\beta \lim_\alpha \lim_i \langle a_\beta \cdot a'''_\alpha, a''_i \rangle \\ &= \lim_\beta \lim_\alpha \lim_i \langle a'''_\alpha, a''_i \square \widehat{a_\beta} \rangle \end{aligned}$$

and

$$(2.2) \quad \begin{aligned} \langle a^{(5)} \cdot a'', a^{(4)} \rangle &= \lim_\alpha \lim_\beta \langle a^{(4)}, a'''_\alpha \cdot a_\beta \rangle = \lim_\alpha \lim_\beta \lim_i \langle a'''_\alpha \cdot a_\beta, a''_i \rangle \\ &= \lim_\alpha \lim_\beta \lim_i \langle a'''_\alpha, \widehat{a_\beta} \square a''_i \rangle. \end{aligned}$$

But the  $A''$ -bimodule structure on  $A^{(5)} = (((A'')')')$  is given as follows:

$$\begin{aligned}
 (2.3) \quad \langle a'' \cdot a^{(5)}, a^{(4)} \rangle &= \langle a^{(5)}, a^{(4)} \cdot a'' \rangle = \lim_{\alpha} \langle a^{(4)} \cdot a'', a''_{\alpha} \rangle \\
 &= \lim_{\alpha} \langle a^{(4)}, a'' \cdot a''_{\alpha} \rangle = \lim_{\alpha} \lim_i \langle a'' \cdot a''_{\alpha}, a''_i \rangle \\
 &= \lim_{\alpha} \lim_i \langle a''_{\alpha}, a''_i \square a'' \rangle
 \end{aligned}$$

and

$$\begin{aligned}
 (2.4) \quad \langle a^{(5)} \cdot a'', a^{(4)} \rangle &= \langle a^{(5)}, a'' \cdot a^{(4)} \rangle = \lim_{\alpha} \langle a'' \cdot a^{(4)}, a''_{\alpha} \rangle \\
 &= \lim_{\alpha} \langle a^{(4)}, a''_{\alpha} \cdot a'' \rangle = \lim_{\alpha} \lim_i \langle a''_{\alpha} \cdot a'', a''_i \rangle \\
 &= \lim_{\alpha} \lim_i \langle a''_{\alpha}, a'' \square a''_i \rangle.
 \end{aligned}$$

So the two  $A''$ -bimodule structures are not equal.

PROPOSITION 2.1. *Let  $A$  be a Banach algebra such that the following maps and  $A''$  are Arens regular:*

$$(i) \begin{cases} A' \times A \rightarrow A', \\ (f, a) \mapsto f \cdot a, \end{cases} \quad (ii) \begin{cases} A'' \times A''' \rightarrow A''', \\ (F, \Lambda) \mapsto F \cdot \Lambda. \end{cases}$$

*Then the two  $A''$ -bimodule structures on  $(((A'')')')$  and  $(((A'')')')''$  coincide.*

*Proof.* First we show  $\varphi : \widehat{A} \rightarrow A''$  ( $\widehat{a} \mapsto \widehat{a} \square G$ ) is  $w^*$ - $w$ -continuous for all  $G \in A''$ . For a net  $(\widehat{a}_{\alpha})$  in  $\widehat{A}$  and for  $a''' = w^*\text{-}\lim_{\beta} \widehat{f}_{\beta} \in A'''$  such that  $(f_{\beta})$  is a net in  $A'$  we have

$$\begin{aligned}
 \langle a''', (w^*\text{-}\lim_{\alpha} \widehat{a}_{\alpha}) \square G \rangle &= \langle a''', w^*\text{-}\lim_{\alpha} (\widehat{a}_{\alpha} \square G) \rangle = \lim_{\beta} \langle w^*\text{-}\lim_{\alpha} (\widehat{a}_{\alpha} \square G), f_{\beta} \rangle \\
 &= \lim_{\beta} \lim_{\alpha} \langle G, f_{\beta} \cdot a_{\alpha} \rangle = \lim_{\beta} \lim_{\alpha} \langle \widehat{f}_{\beta} \cdot \widehat{a}_{\alpha}, G \rangle \\
 &= \lim_{\alpha} \lim_{\beta} \langle \widehat{f}_{\beta} \cdot \widehat{a}_{\alpha}, G \rangle = \lim_{\alpha} \lim_{\beta} \langle G, f_{\beta} \cdot a_{\alpha} \rangle \\
 &= \lim_{\alpha} \lim_{\beta} \langle \widehat{a}_{\alpha} \square G, f_{\beta} \rangle = \lim_{\alpha} \lim_{\beta} \langle \widehat{f}_{\beta}, \widehat{a}_{\alpha} \square G \rangle \\
 &= \lim_{\alpha} \langle a''', \widehat{a}_{\alpha} \square G \rangle.
 \end{aligned}$$

This proves the  $w^*$ - $w$ -continuity of  $\varphi$ . On the other hand for the nets  $(a_{\alpha})$  and  $(f_{\beta})$  in  $A$  and  $A'$  respectively, by Arens regularity of the map in (ii), for  $F \in A''$  we have

$$\begin{aligned}
 \langle w^*\text{-}\lim_{\alpha} w^*\text{-}\lim_{\beta} \widehat{a_{\alpha}} \cdot \widehat{f_{\beta}}, F \rangle &= \lim_{\alpha} \lim_{\beta} \langle \widehat{a_{\alpha}} \cdot \widehat{f_{\beta}}, F \rangle = \lim_{\alpha} \lim_{\beta} \langle \widehat{a_{\alpha}} \cdot \widehat{f_{\beta}}, F \rangle \\
 &= \lim_{\alpha} \lim_{\beta} \langle \widehat{a_{\alpha}} \cdot \widehat{f_{\beta}}, \widehat{F} \rangle = \lim_{\beta} \lim_{\alpha} \langle \widehat{a_{\alpha}} \cdot \widehat{f_{\beta}}, \widehat{F} \rangle \\
 &= \langle w^*\text{-}\lim_{\alpha} w^*\text{-}\lim_{\beta} \widehat{a_{\alpha}} \cdot \widehat{f_{\beta}}, F \rangle.
 \end{aligned}$$

This proves the Arens regularity of the map  $A \times A' \rightarrow A'$  ( $(a, f) \mapsto a.f$ ), and similarly we deduce the  $w^*$ - $w$ -continuity of the map  $\widehat{A} \rightarrow A''$  ( $\widehat{a} \mapsto G \square \widehat{a}$ ) for all  $G \in A''$ .

For the rest of proof we continue equality (2.3):

$$\begin{aligned} \langle a'' . a^{(5)}, a^{(4)} \rangle &= \lim_{\alpha} \lim_i \langle a'''_{\alpha}, a''_i \square a'' \rangle = \lim_{\alpha} \lim_i \lim_{\beta} \langle a'''_{\alpha}, a''_i \square \widehat{a}_{\beta} \rangle \\ &= \lim_{\alpha} \lim_{\beta} \lim_i \langle a'''_{\alpha}, a''_i \square \widehat{a}_{\beta} \rangle = \lim_{\alpha} \lim_{\beta} \lim_i \langle a_{\beta} . a'''_{\alpha}, a''_i \rangle \\ &= \lim_{\alpha} \lim_{\beta} \langle \widehat{a}_{\beta} . a'''_{\alpha}, a^{(4)} \rangle = \lim_{\beta} \lim_{\alpha} \langle \widehat{a}_{\beta} . a'''_{\alpha}, a^{(4)} \rangle \\ &= \lim_{\beta} \lim_{\alpha} \lim_i \langle a'''_{\alpha}, a''_i \square \widehat{a}_{\beta} \rangle; \end{aligned}$$

this proves the equality of (2.1) and (2.3). Similarly we continue equality (2.4):

$$\begin{aligned} \langle a^{(5)} . a'', a^{(4)} \rangle &= \lim_{\alpha} \lim_i \langle a'''_{\alpha}, a'' \square a''_i \rangle = \lim_{\alpha} \lim_i \lim_{\beta} \langle a'''_{\alpha}, \widehat{a}_{\beta} \square a''_i \rangle \\ &= \lim_{\alpha} \lim_{\beta} \lim_i \langle a'''_{\alpha}, \widehat{a}_{\beta} \square a''_i \rangle, \end{aligned}$$

which proves the equality of (2.2) and (2.4). ■

We need the following lemma to extend our results to  $A^{(7)}$ .

LEMMA 2.2. *Let  $A$  be a Banach algebra such that the following maps and  $A^{(4)}$  are Arens regular:*

$$(i) \begin{cases} A''' \times A'' \rightarrow A''', \\ (\Lambda, F) \mapsto \Lambda.F, \end{cases} \quad (ii) \begin{cases} A^{(4)} \times A^{(5)} \rightarrow A^{(5)}, \\ (\Lambda, F) \mapsto \Lambda.F. \end{cases}$$

*Then the following maps and  $A''$  are Arens regular:*

$$(a) \begin{cases} A' \times A \rightarrow A', \\ (f, a) \mapsto f.a, \end{cases} \quad (b) \begin{cases} A'' \times A''' \rightarrow A''', \\ (F, \Lambda) \mapsto F.\Lambda. \end{cases}$$

*Proof.* For Arens regularity of  $A''$  take nets  $(F_{\alpha})$  and  $(G_{\beta})$  in  $A''$  and  $a''' \in A'''$ , so  $(\widehat{F}_{\alpha})$  and  $(\widehat{G}_{\beta})$  are nets in  $A^{(4)}$  and  $\widehat{a}''' \in A^{(5)}$ . By Arens regularity of  $A^{(4)}$  we have

$$\begin{aligned} \lim_{\alpha} \lim_{\beta} \langle a''', F_{\alpha} \square G_{\beta} \rangle &= \lim_{\alpha} \lim_{\beta} \langle \widehat{a}''', \widehat{F}_{\alpha} \square \widehat{G}_{\beta} \rangle = \lim_{\beta} \lim_{\alpha} \langle \widehat{a}''', \widehat{F}_{\alpha} \square \widehat{G}_{\beta} \rangle \\ &= \lim_{\beta} \lim_{\alpha} \langle a''', F_{\alpha} \square G_{\beta} \rangle. \end{aligned}$$

This proves the Arens regularity of  $A''$ . Now suppose that  $(f_{\alpha})$  and  $(a_{\beta})$  are nets in  $A'$  and  $A$  respectively, and let  $F \in A''$ , so  $(\widehat{f}_{\alpha})$  and  $(\widehat{a}_{\beta})$  are nets in

$A'''$  and  $A''$  respectively and  $\widehat{F} \in A^{(4)}$ . By Arens regularity of (i) we have

$$\begin{aligned} \langle w^*\text{-}\lim_{\alpha} w^*\text{-}\lim_{\beta} \widehat{f_{\alpha} \cdot a_{\beta}}, F \rangle &= \lim_{\alpha} \lim_{\beta} \langle \widehat{f_{\alpha} \cdot a_{\beta}}, F \rangle = \lim_{\alpha} \lim_{\beta} \langle \widehat{f_{\alpha} \cdot a_{\beta}}, \widehat{F} \rangle \\ &= \lim_{\beta} \lim_{\alpha} \langle \widehat{f_{\alpha} \cdot a_{\beta}}, \widehat{F} \rangle \\ &= \langle w^*\text{-}\lim_{\beta} w^*\text{-}\lim_{\alpha} \widehat{f_{\alpha} \cdot a_{\beta}}, F \rangle, \end{aligned}$$

which proves the Arens regularity of (a). Similarly the Arens regularity of (ii) implies the Arens regularity of (b). ■

Now we are ready to consider two  $A^{(4)}$ -bimodule structures on  $A^{(7)}$ . Take  $a^{(7)} \in A^{(7)}$ ,  $a^{(6)} \in A^{(6)}$  and  $a^{(4)} \in A^{(4)}$  with bounded nets  $(a_{\beta}^{(5)}) \subset A^{(5)}$ ,  $(a_i^{(4)}) \subset A^{(4)}$  and  $(a''_{\alpha}) \subset A''$  such that  $a^{(7)} = w^*\text{-}\lim_{\beta} a_{\beta}^{(5)}$ ,  $a^{(6)} = w^*\text{-}\lim_i a_i^{(4)}$  and  $a^{(4)} = w^*\text{-}\lim_{\alpha} a''_{\alpha}$ .

For the  $A^{(4)}$ -bimodule structure on  $A^{(7)} = (((A')')'')''$  we can write

$$\begin{aligned} (2.5) \quad \langle a^{(4)} \cdot a^{(7)}, a^{(6)} \rangle &= \lim_{\alpha} \lim_{\beta} \langle a^{(6)}, a''_{\alpha} \cdot a_{\beta}^{(5)} \rangle \\ &= \lim_{\alpha} \lim_{\beta} \lim_i \langle a''_{\alpha} \cdot a_{\beta}^{(5)}, a_i^{(4)} \rangle, \end{aligned}$$

$$\begin{aligned} (2.6) \quad \langle a^{(7)} \cdot a^{(4)}, a^{(6)} \rangle &= \lim_{\beta} \lim_{\alpha} \langle a^{(6)}, a_{\beta}^{(5)} \cdot a''_{\alpha} \rangle \\ &= \lim_{\beta} \lim_{\alpha} \lim_i \langle a_{\beta}^{(5)} \cdot a''_{\alpha}, a_i^{(4)} \rangle. \end{aligned}$$

But for the  $A^{(4)}$ -bimodule structure on  $A^{(7)} = (((A'')'')'')'$  we have

$$\begin{aligned} (2.7) \quad \langle a^{(4)} \cdot a^{(7)}, a^{(6)} \rangle &= \langle a^{(7)}, a^{(6)} \cdot a^{(4)} \rangle = \lim_{\beta} \langle a^{(6)} \cdot a^{(4)}, a_{\beta}^{(5)} \rangle \\ &= \lim_{\beta} \langle a^{(6)}, a^{(4)} \cdot a_{\beta}^{(5)} \rangle = \lim_{\beta} \lim_i \langle a^{(4)} \cdot a_{\beta}^{(5)}, a_i^{(4)} \rangle \\ &= \lim_{\beta} \lim_i \langle a_{\beta}^{(5)}, a_i^{(4)} \square a^{(4)} \rangle, \end{aligned}$$

$$\begin{aligned} (2.8) \quad \langle a^{(7)} \cdot a^{(4)}, a^{(6)} \rangle &= \langle a^{(7)}, a^{(4)} \cdot a^{(6)} \rangle = \lim_{\beta} \langle a^{(4)} \cdot a^{(6)}, a_{\beta}^{(5)} \rangle \\ &= \lim_{\beta} \langle a^{(6)}, a_{\beta}^{(5)} \cdot a^{(4)} \rangle = \lim_{\beta} \lim_i \langle a_{\beta}^{(5)} \cdot a^{(4)}, a_i^{(4)} \rangle \\ &= \lim_{\beta} \lim_i \langle a_{\beta}^{(5)}, a^{(4)} \square a_i^{(4)} \rangle. \end{aligned}$$

**PROPOSITION 2.3.** *Let  $A$  be a Banach algebra as in the hypothesis of Lemma 2.2. Then the two  $A^{(4)}$ -bimodule structures on  $((((A')')'')''$  and  $((((A'')'')'')'$  coincide.*

*Proof.* By Lemma 2.2 the hypothesis of Proposition 2.1 holds, and so we can use the equality of the two  $A''$ -bimodule structures on  $A^{(5)} = (((A'')')')$  and  $A^{(5)} = (((A')')'')$ . Our proof is similar to the proof of Proposition 2.1. First we continue equality (2.5):

$$\begin{aligned}
\langle a^{(4)}.a^{(7)}, a^{(6)} \rangle &= \lim_{\alpha} \lim_{\beta} \lim_i \langle a''_{\alpha}.a_{\beta}^{(5)}, a_i^{(4)} \rangle \\
&= \lim_{\alpha} \lim_{\beta} \lim_i \langle a_{\beta}^{(5)}, a_i^{(4)} \square \widehat{a''_{\alpha}} \rangle \quad (\text{by Proposition 2.1}) \\
&= \lim_{\beta} \lim_{\alpha} \lim_i \langle a_{\beta}^{(5)}, a_i^{(4)} \square \widehat{a''_{\alpha}} \rangle \\
&= \lim_{\beta} \lim_i \lim_{\alpha} \langle a_{\beta}^{(5)}, a_i^{(4)} \square \widehat{a''_{\alpha}} \rangle \\
&= \lim_{\beta} \lim_i \langle a_{\beta}^{(5)}, a_i^{(4)} \square a^{(4)} \rangle.
\end{aligned}$$

This proves the equality of (2.5) and (2.7). The proof of the equality of (2.6) and (2.8) is similar. ■

REMARK 2.4. There are many other  $A''$ -bimodule [ $A^{(4)}$ -bimodule] structures on  $A^{(5)}$  [ $A^{(7)}$ ] that we do not need to mention.

The following corollary is about a similar work in [6] for two  $A''$ -bimodule structures on  $A'''$ .

COROLLARY 2.5. *Let  $A$  be a Banach algebra as in the hypothesis of Proposition 2.1. Then the two  $A''$ -bimodule structures on  $A''' = (A')''$  and  $A''' = (A'')'$  coincide.*

*Proof.* The Arens regularity of  $A''$  implies the Arens regularity of  $A$ , and also the Arens regularity of the map in (ii) of Proposition 2.1 implies the Arens regularity of  $\varphi : A \times A' \rightarrow A' ((a, f) \mapsto a.f)$ . Thus the assertion holds by Theorem 2.1 of [6]. ■

**3. 3-weak amenability of  $A^{(2n)}$ .** We recall that by Theorem 1.1, for a continuous derivation  $D : A \rightarrow E$ , the second transpose  $D'' : A'' \rightarrow E''$  and hence the fourth transpose  $D^{(4)} : A^{(4)} \rightarrow E^{(4)}$  are continuous derivations. In this section we consider a continuous derivation  $D : A \rightarrow A^{(3)} = ((A')')'$  and its second and fourth transposes.

LEMMA 3.1. *Let  $A$  be a Banach algebra as in the hypothesis of Proposition 2.1. If the second transpose of a continuous derivation  $D : A \rightarrow A''' = ((A')')'$  is inner, then  $D$  is inner.*

*Proof.* Since  $D'' : A'' \rightarrow (((A')')')'' = A^{(5)}$  is inner, there is an  $a^{(5)} \in A^{(5)}$  such that  $D''(a'') = a'' . a^{(5)} - a^{(5)} . a''$  ( $a'' \in A''$ ), where the  $A''$ -bimodule structure is as in (2.1) and (2.2). Let  $a^{(3)} = i^*(a^{(5)})$  where  $i : A'' \rightarrow (A'')'' =$

$A^{(4)}$  is the natural map and so  $i^* : ((A'')'')' = A^{(5)} \rightarrow A^{(3)} = (A'')'$ . Then for  $a'' \in A''$  we have

$$\begin{aligned} \langle D(a), a'' \rangle &= \langle \widehat{D(a)}, \widehat{a''} \rangle = \langle D''(\hat{a}), \widehat{a''} \rangle = \langle \hat{a}.a^{(5)} - a^{(5)}.\hat{a}, \widehat{a''} \rangle \\ &= \langle a^{(5)}, \widehat{a''}.\hat{a} - \hat{a}.\widehat{a''} \rangle = \langle a^{(5)}, a''.\widehat{a} - a.a'' \rangle \\ &= \langle i^*(a^{(5)}), a''.a - a.a'' \rangle = \langle a.a^{(3)} - a^{(3)}.a, a'' \rangle. \end{aligned}$$

Thus  $D(a) = a.a^{(3)} - a^{(3)}.a$ . ■

By using Lemma 2.2 we can similarly prove the following lemma:

**LEMMA 3.2.** *Let  $A$  be a Banach algebra as in the hypothesis of Lemma 2.2. If the fourth transpose of a continuous derivation  $D : A \rightarrow A''' = ((A')')'$  is inner then  $D''$  and  $D$  are inner.*

**PROPOSITION 3.3.** *Let  $A$  be a Banach algebra as in the hypothesis of Proposition 2.1. If  $A''$  is 3-weakly amenable then so is  $A$ .*

*Proof.* Suppose that  $D : A \rightarrow A^{(3)} = ((A')')'$  is a continuous derivation. Then  $D'' : A'' \rightarrow A^{(5)} = (((A')')')''$  is again a derivation by Theorem 1.1. We know that the two  $A''$ -bimodule structures on  $A^{(5)} = (((A')')')''$  and  $A^{(5)} = (((A'')')')'$  are equal by Proposition 2.1, so  $D'' : A'' \rightarrow A^{(5)} = (((A'')')')'$  is also a derivation. Thus  $D''$  is inner because  $A''$  is 3-weakly amenable. Finally  $D$  is inner by Lemma 3.1, and this proves the 3-weak amenability of  $A$ . ■

**PROPOSITION 3.4.** *Let  $A$  be a Banach algebra as in the hypothesis of Lemma 2.2. If  $A^{(4)}$  is 3-weakly amenable then so is  $A$ .*

*Proof.* This is a consequence of Proposition 2.3 and Lemma 3.2. ■

Now we can extend Propositions 3.3 and 3.4 as follows:

**THEOREM 3.5.** *Let  $n \geq 1$  and  $A$  be a Banach algebra such that the following maps and  $A^{(2n)}$  are Arens regular:*

$$(i) \begin{cases} A^{(2n-1)} \times A^{(2n-2)} \rightarrow A^{(2n-1)}, \\ (\Lambda, F) \mapsto \Lambda.F, \end{cases} \quad (ii) \begin{cases} A^{(2n)} \times A^{(2n+1)} \rightarrow A^{(2n+1)}, \\ (F, \Lambda) \mapsto F.\Lambda. \end{cases}$$

*If  $A^{(2n)}$  is 3-weakly amenable then  $A$  is 3-weakly amenable and hence it is weakly amenable.*

**EXAMPLE 3.6.**  $C^*$ -algebras are standard examples of Banach algebras that are Arens regular and have a bounded approximate identity. The second dual  $A''$  of a  $C^*$ -algebra  $A$  is itself a  $C^*$ -algebra and a von Neumann algebra [3, Corollary 3.2.37]. Every  $C^*$ -algebra is  $n$ -weakly amenable for each  $n$  (see [4]), so the conclusions of Theorem 3.5 hold for any  $C^*$ -algebras, but the assumptions only hold for finite-dimensional ones [5, Corollary 4.6].

According to Corollary 2.5 and Proposition 4.5 in [5], it seems that an example of the conditions in Proposition 2.1, with a non-reflexive Banach

algebra, can only be obtained when the algebra has no two sided bounded approximate identity.

EXAMPLE 3.7. Assume that  $A$  is a non-reflexive complex Banach space and  $\varphi : A \rightarrow \mathbb{C}$  is a bounded linear functional. Define a multiplication on  $A$  by  $ab = \langle \varphi, a \rangle b$ . This makes  $A$  into a Banach algebra which is called the ideally factored algebra associated to  $\varphi$ . It is easy to check that  $\varphi$  is multiplicative and also

$$\begin{aligned} a.f &= \langle f, a \rangle \varphi, & f.a &= \langle \varphi, a \rangle f, & f.F &= \langle F, \varphi \rangle f, & F.f &= \langle F, f \rangle \varphi, \\ F \square G &= F \diamond G = \langle F, \varphi \rangle G, & F.\Lambda &= \langle \Lambda, F \rangle \widehat{\varphi}, & \Lambda.F &= \langle F, \varphi \rangle \Lambda, \end{aligned}$$

for  $a \in A$ ,  $f \in A'$ ,  $\varphi \in A'''$  and  $F, G \in A''$ . Now for bounded nets  $(a_i)$  and  $(f_j)$  in  $A$  and  $A'$  respectively, we have

$$\begin{aligned} w^*\text{-}\lim_i w^*\text{-}\lim_j \widehat{f_j a_i} &= w^*\text{-}\lim_i w^*\text{-}\lim_j \langle \varphi, a_i \rangle \widehat{f_j} \\ &= w^*\text{-}\lim_i \langle \varphi, a_i \rangle w^*\text{-}\lim_j \widehat{f_j}. \end{aligned}$$

This proves the Arens regularity of the map  $A' \times A \rightarrow A'$   $((f, a) \mapsto f.a)$ . Since  $A$  is not reflexive, the map  $A \times A' \rightarrow A'$   $((a, f) \mapsto a.f)$  is not Arens regular, because

$$\begin{aligned} w^*\text{-}\lim_i w^*\text{-}\lim_j \widehat{a_i f_j} &= w^*\text{-}\lim_i w^*\text{-}\lim_j \langle f_j, a_i \rangle \varphi \\ &\neq w^*\text{-}\lim_j w^*\text{-}\lim_i \langle f_j, a_i \rangle \varphi. \end{aligned}$$

Similarly we can check that  $A$  and  $A''$  and the map  $A''' \times A'' \rightarrow A'''$   $((\Lambda, F) \mapsto \Lambda.F)$  are Arens regular, but the map  $A'' \times A''' \rightarrow A'''$   $((F, \Lambda) \mapsto F.\Lambda)$  is not Arens regular. Now for  $a, b \in A$  we have

$$\varphi(ab) = \varphi(\langle \varphi, a \rangle b) = \langle \varphi, a \rangle \langle \varphi, b \rangle = \varphi(ba),$$

so if  $\varphi$  is one-to-one then  $ab = ba$ , that is,  $A$  is commutative. In this situation the assumptions of Proposition 2.1 hold.
