# The set of minimal distances in Krull monoids 

by<br>Alfred Geroldinger and Qinghai Zhong (Graz)

1. Introduction. Let $H$ be a Krull monoid with class group $G$ (we have in mind holomorphy rings in global fields and give more examples later). Then every nonunit of $H$ has a factorization as a finite product of atoms (or irreducible elements), and all these factorizations are unique (i.e., $H$ is factorial) if and only if $G$ is trivial. Otherwise, there are elements having factorizations which differ not only up to associates and up to the order of the factors. These phenomena are described by arithmetical invariants such as sets of lengths and sets of distances. We first recall some concepts and then we formulate a main result of the present paper.

For a finite nonempty set $L=\left\{m_{1}, \ldots, m_{k}\right\}$ of positive integers with $m_{1}<\cdots<m_{k}$, we denote by $\Delta(L)=\left\{m_{i}-m_{i-1} \mid i \in[2, k]\right\}$ the set of distances of $L$. Thus $\Delta(L)=\emptyset$ if and only if $|L| \leq 1$. If a nonunit $a \in H$ has a factorization $a=u_{1} \cdot \ldots \cdot u_{k}$ into atoms $u_{1}, \ldots, u_{k}$, then $k$ is called the length of the factorization, and the set $\mathrm{L}_{H}(a)=\mathrm{L}(a)$ of all possible $k$ is called the set of lengths of $a$. If there is an element $a \in H$ with $|\mathrm{L}(a)|>1$, then it immediately follows that $\left|\mathrm{L}\left(a^{n}\right)\right|>n$ for every $n \in \mathbb{N}$. Since $H$ is Krull, every nonunit has a factorization into atoms and all sets of lengths are finite. The set of distances $\Delta(H)$ is the union of all sets $\Delta(\mathrm{L}(a))$ over all nonunits $a \in H$. Thus, by definition, $\Delta(H)=\emptyset$ if and only if $|\mathrm{L}(a)|=1$ for all nonunits $a \in H$, and $\Delta(H)=\{d\}$ if and only if $\mathrm{L}(a)$ is an arithmetical progression with difference $d$ for all nonunits $a \in H$. The set of minimal distances $\Delta^{*}(H)$ is defined as
$\Delta^{*}(H)=\{\min \Delta(S) \mid S \subset H$ is a divisor-closed submonoid with $\Delta(S) \neq \emptyset\}$. By definition, we have $\Delta^{*}(H) \subset \Delta(H)$, and $\Delta^{*}(H)=\emptyset$ if and only if $\Delta(H)=\emptyset$. If the class group $G$ is finite, then $\Delta(H)$ is finite and sets of

[^0]lengths have a well-defined structure which is given in the next theorem [13, Chapter 4.7].

Theorem A. Let $H$ be a Krull monoid with finite class group. Then there is a constant $M \in \mathbb{N}$ such that the set of lengths $\mathrm{L}(a)$ of any nonunit $a \in H$ is an AAMP (almost arithmetical multiprogression) with difference $d \in \Delta^{*}(H)$ and bound $M$.

The structural description given above is best possible [32]. The set of minimal distances $\Delta^{*}(H)$ has been studied by Chapman, Geroldinger, Halter-Koch, Hamidoune, Plagne, Smith, Schmid and others, and there are a variety of results. We refer the reader to the monograph [13, Chapter 6.8] for an overview and mention some results which have appeared since then. Suppose that $G$ is finite and that every class contains a prime divisor. Then the set of distances $\Delta(H)$ is an interval [18]. A simple example shows that the interval $[1, \mathrm{r}(G)-1]$ is contained in $\Delta^{*}(H)$ (Lemma 2.3) and thus, by Theorem 1.1 below, $\Delta^{*}(H)$ is an interval too if $r(G) \geq \exp (G)-1$. Cyclic groups stand in sharp contrast to this. Indeed, if $G$ is cyclic with $|G|>3$, then $\max \left(\Delta^{*}(H) \backslash\{|G|-2\}\right)=\lfloor|G| / 2\rfloor-1$ (see [14]). A detailed study of the structure of $\Delta^{*}(H)$ for cyclic groups is given in a recent paper by Plagne and Schmid [23].

The goal of the present paper is to study the maximum of $\Delta^{*}(H)$, and here is the main direct result.

Theorem 1.1. Let $H$ be a Krull monoid with class group $G$.
(1) If $|G| \leq 2$, then $\Delta^{*}(H)=\emptyset$.
(2) If $2<|G|<\infty$, then

$$
\max \Delta^{*}(H) \leq \max \{\exp (G)-2, \mathrm{r}(G)-1\}
$$

where $\mathrm{r}(G)$ denotes the rank of $G$.
(3) Suppose that every class contains a prime divisor. If $G$ is infinite, then $\Delta^{*}(H)=\mathbb{N}$, while if $2<|G|<\infty$, then

$$
\max \Delta^{*}(H)=\max \{\exp (G)-2, r(G)-1\}
$$

Theorem 1.1 will be complemented by an associated inverse result (Theorem 4.5 describing how max $\Delta^{*}(H)$ is attained and disproving a former conjecture (Remark 4.6). Both the direct and the inverse result have numbertheoretic relevance beyond the occurrence in Theorem A. Indeed, they are key tools in the characterization of those Krull monoids whose systems of sets of lengths are closed under set addition [17], in the study of arithmetical characterizations of class groups via sets of lengths [13, Chapter 7.3], [31, 16], as well as in the asymptotic study of counting functions associated to periods of sets of lengths [30], [13, Theorem 9.4.10].

In Section 2 we gather the required background from the theory of Krull monoids and from additive combinatorics. In particular, we indicate that the set of minimal distances of $H$ equals the set of minimal distances of an associated monoid of zero-sum sequences (Lemma 2.1), and therefore it can be studied with methods from additive combinatorics. The proof of Theorem 1.1 will be given in Section 3 and the associated inverse result will be given in Section 4.

## 2. Background on Krull monoids and on additive combinatorics.

 We denote by $\mathbb{N}$ the set of positive integers, and, for $a, b \in \mathbb{Z}$, we denote by $[a, b]=\{x \in \mathbb{Z} \mid a \leq x \leq b\}$ the discrete, finite interval between $a$ and $b$. We use the convention that $\max \emptyset=0$. By a monoid, we mean a commutative semigroup with identity that satisfies the cancellation laws. If $H$ is a monoid, then $H^{\times}$denotes the unit group, $\mathrm{q}(H)$ the quotient group, and $\mathcal{A}(H)$ the set of atoms (or irreducible elements) of $H$. A submonoid $S \subset H$ is called divisor-closed if $a \in S, b \in H$, and $b$ divides $a$ imply that $b \in S$. A monoid $H$ is said to be- atomic if every nonunit can be written as a finite product of atoms;
- factorial if it is atomic and every atom is prime;
- half-factorial if it is atomic and $|\mathrm{L}(a)|=1$ for each nonunit $a \in H$ (equivalently, $\Delta(H)=\emptyset$ );
- decomposable if there exist submonoids $H_{1}, H_{2}$ with $H_{i} \not \subset H^{\times}$for $i \in[1,2]$ such that $H=H_{1} \times H_{2}$ (and $H$ is called indecomposable otherwise).

A monoid $F$ is factorial with $F^{\times}=\{1\}$ if and only if it is free abelian. If this holds, then the set of primes $P \subset F$ is a basis of $F$, we write $F=\mathcal{F}(P)$, and every $a \in F$ has a representation of the form

$$
a=\prod_{p \in P} p^{\mathrm{v}_{p}(a)} \quad \text { with } \mathrm{v}_{p}(a) \in \mathbb{N}_{0} \text { and } \mathrm{v}_{p}(a)=0 \text { for almost all } p \in P .
$$

A monoid homomorphism $\theta: H \rightarrow B$ is called a transfer homomorphism if it has the following properties:
(T1) $B=\theta(H) B^{\times}$and $\theta^{-1}\left(B^{\times}\right)=H^{\times}$.
(T2) If $u \in H, b, c \in B$ and $\theta(u)=b c$, then there exist $v, w \in H$ such that $u=v w, \theta(v) \simeq b$ and $\theta(w) \simeq c$.
If $H$ and $B$ are atomic monoids and $\theta: H \rightarrow B$ is a transfer homomorphism, then (see [13, Chapter 3.2])

$$
\mathrm{L}_{H}(a)=\mathrm{L}_{B}(\theta(a)) \quad \text { for all } a \in H, \quad \Delta(H)=\Delta(B), \quad \Delta^{*}(H)=\Delta^{*}(B)
$$

Krull monoids. A monoid $H$ is said to be a Krull monoid if it satisfies the following two conditions:
(a) There exists a monoid homomorphism $\varphi: H \rightarrow F=\mathcal{F}(P)$ into a free abelian monoid $F$ such that $a \mid b$ in $H$ if and only if $\varphi(a) \mid \varphi(b)$ in $F$.
(b) For every $p \in P$, there exists a finite subset $E \subset H$ such that $p=\operatorname{gcd}(\varphi(E))$.
Let $H$ be a Krull monoid and $\varphi: H \rightarrow \mathcal{F}(P)$ a homomorphism satisfying properties (a) and (b). Then $\varphi$ is called a divisor theory of $H$,

$$
G=\mathrm{q}(F) / \mathrm{q}(\varphi(H))
$$

is the class group, and

$$
G_{P}=\{[p]=p \mathbf{q}(\varphi(H)) \mid p \in P\} \subset G
$$

the set of classes containing prime divisors. The class group will be written additively, and the tuple $\left(G, G_{P}\right)$ is uniquely determined by $H$. To provide some examples of Krull monoids, we recall that a domain is a Krull domain if and only if its multiplicative monoid of nonzero elements is a Krull monoid, and that a noetherian domain is Krull if and only if it is integrally closed. Rings of integers, holomorphy rings in algebraic function fields, and regular congruence monoids in these domains are Krull monoids with finite class group such that every class contains a prime divisor [12, [13, Chapter 2.11]. For monoids of modules and monoid domains which are Krull we refer to [22, 4, 3, 1].

Next we introduce Krull monoids having a combinatorial flavor which are used to model arbitrary Krull monoids. Let $G$ be an additively written abelian group and $G_{0} \subset G$ a subset. An element $S=g_{1} \cdot \ldots \cdot g_{l} \in \mathcal{F}\left(G_{0}\right)$ is called a sequence over $G_{0}, \sigma(S)=g_{1}+\cdots+g_{l}$ is called its sum, $|S|=l$ its length, and $\mathrm{h}(S)=\max \left\{\mathrm{v}_{g}(S) \mid g \in \operatorname{supp}(S)\right\}$ the maximal multiplicity of $S$. The monoid

$$
\mathcal{B}\left(G_{0}\right)=\left\{S \in \mathcal{F}\left(G_{0}\right) \mid \sigma(S)=0\right\}
$$

is a Krull monoid, called the monoid of zero-sum sequences over $G_{0}$. Its significance for the study of general Krull monoids is summarized in the following lemma (see [13, Theorem 3.4.10 and Proposition 4.3.13]).

Lemma 2.1. Let $H$ be a Krull monoid, $\varphi: H \rightarrow D=\mathcal{F}(P)$ a divisor theory with class group $G$, and $G_{P} \subset G$ the set of classes containing prime divisors. Let $\widetilde{\boldsymbol{\beta}}: D \rightarrow \mathcal{F}\left(G_{P}\right)$ denote the unique homomorphism defined by $\widetilde{\boldsymbol{\beta}}(p)=[p]$ for all $p \in P$. Then the homomorphism $\boldsymbol{\beta}=\widetilde{\boldsymbol{\beta}} \circ \varphi: H \rightarrow \mathcal{B}\left(G_{P}\right)$ is a transfer homomorphism. In particular,
$\Delta^{*}(H)=\Delta^{*}\left(\mathcal{B}\left(G_{P}\right)\right)=\left\{\min \Delta\left(\mathcal{B}\left(G_{0}\right)\right) \mid G_{0} \subset G_{P}\right.$ is a subset such that $\mathcal{B}\left(G_{0}\right)$ is not half-factorial\}.

Thus $\Delta^{*}(H)$ can be studied in an associated monoid of zero-sum sequences and can thus be tackled by methods of additive combinatorics. Such transfer results to monoids of zero-sum sequences are not restricted to Krull monoids, but they also exist for certain seminormal weakly Krull monoids and certain maximal orders in central simple algebras over global fields. We do not dwell on this here but refer to [33, Theorem 1.1], [15], and [2, Section 7].

Zero-sum theory is a subfield of additive combinatorics (see the monograph [20], the survey [10], and for a sample of recent papers on direct and inverse zero-sum problems with a strong number-theoretic flavor see [19, 8, 21, 34, 6]). We gather together the concepts needed in what follows.

Let $G$ be a finite abelian group and $G_{0} \subset G$ a subset. Then $\left\langle G_{0}\right\rangle \subset G$ denotes the subgroup generated by $G_{0}$. A family $\left(e_{i}\right)_{i \in I}$ of elements of $G$ is said to be independent if $e_{i} \neq 0$ for all $i \in I$ and, for every family $\left(m_{i}\right)_{i \in I} \in \mathbb{Z}^{(I)}$,

$$
\sum_{i \in I} m_{i} e_{i}=0 \quad \text { implies } \quad m_{i} e_{i}=0 \text { for all } i \in I
$$

A family $\left(e_{i}\right)_{i \in I}$ is called a basis for $G$ if $e_{i} \neq 0$ for all $i \in I$ and $G=\bigoplus_{i \in I}\left\langle e_{i}\right\rangle$. The set $G_{0}$ is said to be independent if the tuple $(g)_{g \in G_{0}}$ is independent. If for a prime $p \in \mathbb{P}, \mathrm{r}_{p}(G)$ is the $p$-rank of $G$, then

$$
\begin{aligned}
\mathrm{r}(G) & =\max \left\{\mathrm{r}_{p}(G) \mid p \in \mathbb{P}\right\} \text { is the rank of } G, \text { and } \\
\mathrm{r}^{*}(G) & =\sum_{p \in \mathbb{P}} \mathrm{r}_{p}(G) \text { is the total rank of } G .
\end{aligned}
$$

The monoid $\mathcal{B}\left(G_{0}\right)$ of zero-sum sequences over $G_{0}$ is a finitely generated Krull monoid. It is traditional to set

$$
\mathcal{A}\left(G_{0}\right):=\mathcal{A}\left(\mathcal{B}\left(G_{0}\right)\right), \quad \Delta\left(G_{0}\right):=\Delta\left(\mathcal{B}\left(G_{0}\right)\right), \quad \Delta^{*}\left(G_{0}\right):=\Delta^{*}\left(\mathcal{B}\left(G_{0}\right)\right)
$$

Clearly, the atoms of $\mathcal{B}\left(G_{0}\right)$ are precisely the minimal zero-sum sequences over $G_{0}$. The set $\mathcal{A}\left(G_{0}\right)$ is finite, and $\mathrm{D}\left(G_{0}\right)=\max \left\{|S| \mid S \in \mathcal{A}\left(G_{0}\right)\right\}$ is the Davenport constant of $G_{0}$. The set $G_{0}$ is called

- half-factorial if the monoid $\mathcal{B}\left(G_{0}\right)$ is half-factorial (equivalently, $\Delta\left(G_{0}\right)$ $=\emptyset)$;
- non-half-factorial if the monoid $\mathcal{B}\left(G_{0}\right)$ is not half-factorial (equivalently, $\left.\Delta\left(G_{0}\right) \neq \emptyset\right)$;
- minimal non-half-factorial if $\Delta\left(G_{0}\right) \neq \emptyset$ but every proper subset is half-factorial;
- (in)decomposable if the monoid $\mathcal{B}\left(G_{0}\right)$ is (in)decomposable.

If $G_{0}$ is not half-factorial, then $\min \Delta\left(G_{0}\right)=\operatorname{gcd} \Delta\left(G_{0}\right)$ [13, Proposition 1.4.4]. (Maximal) half-factorial and (minimal) non-half-factorial subsets have found a lot of attention in the literature (see [11, 28, 24, 25, 29, 5, 6]),
and cross numbers are a crucial tool for their study. For a sequence $S=$ $g_{1} \cdot \ldots \cdot g_{l} \in \mathcal{F}\left(G_{0}\right)$, we call

$$
\begin{aligned}
\mathrm{k}(S) & =\sum_{i=1}^{l} \frac{1}{\operatorname{ord}\left(g_{i}\right)} \in \mathbb{Q}_{\geq 0} \quad \text { the cross number of } S, \text { and } \\
\mathrm{K}\left(G_{0}\right) & =\max \left\{\mathrm{k}(S) \mid S \in \mathcal{A}\left(G_{0}\right)\right\} \quad \text { the cross number of } G_{0}
\end{aligned}
$$

The following simple result [13, Proposition 6.7.3] will be used throughout the paper without further mention.

Lemma 2.2. Let $G$ be a finite abelian group and $G_{0} \subset G$ a subset. Then the following statements are equivalent:
(a) $G_{0}$ is half-factorial.
(b) $\mathrm{k}(U)=1$ for every $U \in \mathcal{A}\left(G_{0}\right)$.
(c) $\mathrm{L}(B)=\{\mathrm{k}(B)\}$ for every $B \in \mathcal{B}\left(G_{0}\right)$.

In the remainder of this section we gather some simple, partly well-known results on the set of minimal distances. A proof of the next lemma can be found in [13, Chapter 6.8], but for better readability we provide the short argument here.

Lemma 2.3. Let $G$ be a finite abelian group with $|G|>2$.
(1) If $g \in G$ with $\operatorname{ord}(g)>2$, then $\operatorname{ord}(g)-2 \in \Delta^{*}(G)$. In particular, $\exp (G)-2 \in \Delta^{*}(G)$.
(2) If $\mathrm{r}(G) \geq 2$, then $[1, \mathrm{r}(G)-1] \subset \Delta^{*}(G)$.
(3) Let $G_{0} \subset G$ be a subset.
(a) If there exists $U \in \mathcal{A}\left(G_{0}\right)$ with $\mathrm{k}(U)<1$, then min $\Delta\left(G_{0}\right) \leq$ $\exp (G)-2$
(b) If $\mathrm{k}(U) \geq 1$ for all $U \in \mathcal{A}\left(G_{0}\right)$, then $\min \Delta\left(G_{0}\right) \leq\left|G_{0}\right|-2$.

Proof. (1) Let $g \in G$ with $\operatorname{ord}(g)=n>2$ and set $G_{0}=\{g,-g\}$. Then $\mathcal{A}\left(G_{0}\right)=\left\{g^{n},(-g)^{n},(-g) g\right\}, \Delta\left(G_{0}\right)=\{n-2\}$, and hence $\min \Delta\left(G_{0}\right)=$ $n-2$.
(2) Let $s \in[2, \mathrm{r}(G)]$. Then there is a prime $p \in \mathbb{P}$ such that $C_{p}^{s}$ is isomorphic to a subgroup of $G$, and it suffices to show that $s-1 \in \Delta^{*}\left(C_{p}^{s}\right)$. Let $\left(e_{1}, \ldots, e_{s}\right)$ be a basis of $C_{p}^{s}$ and set $e_{0}=e_{1}+\cdots+e_{s}$ and $G_{0}=\left\{e_{0}, \ldots, e_{s}\right\}$. Then a simple calculation (details can be found in [13, Proposition 6.8.1]) shows that $\Delta\left(G_{0}\right)=\{s-1\}$ and hence $\min \Delta\left(G_{0}\right)=s-1$.
(3)(a) Let $U=g_{1} \cdot \ldots \cdot g_{l} \in \mathcal{A}\left(G_{0}\right)$ with $\mathrm{k}(U)<1$ and $n=\exp (G)$ (note that $\mathrm{k}(U)<1$ implies $U \neq 0, l \geq 2$ and $\mathrm{k}(U)>1 / n)$. Then $U_{i}=g_{i}^{\operatorname{ord}\left(g_{i}\right)} \in$ $\mathcal{A}\left(G_{0}\right)$ for all $i \in[1, l]$, and

$$
U^{n}=\prod_{i=1}^{l} U_{i}^{n / \operatorname{ord}\left(g_{i}\right)}
$$

implies that $n \mathrm{k}(U)=\sum_{i=1}^{l} n / \operatorname{ord}\left(g_{i}\right) \in \mathrm{L}\left(U^{n}\right)$. Since $\mathrm{k}(U)<1$, we have $n \mathrm{k}(U) \in[2, n-1]$ and $\min \Delta\left(G_{0}\right) \leq n-n \mathrm{k}(U) \in[1, n-2]$.
$(3)(\mathrm{b})$ The proof is similar to that of $(3)(\mathrm{a})$-see [13, Lemma 6.8.6] for details.

Lemma 2.3(3) motivates the following definitions (see [30, 31]). A subset $G_{0} \subset G$ is called an LCN-set (large cross number set) if $\mathrm{k}(U) \geq 1$ for each $U \in \mathcal{A}\left(G_{0}\right)$ and
$\mathrm{m}(G)=\max \left\{\min \Delta\left(G_{0}\right) \mid G_{0} \subset G\right.$ is a non-half-factorial LCN-set $\}$.
Clearly, if $G$ has a non-half-factorial LCN-set, then $|G| \geq 4$. The following result (due to Schmid [31) is crucial for our approach.

Proposition 2.4. Let $G$ be a finite abelian group with $|G|>2$. Then $\max \Delta^{*}(G)=\max \{\exp (G)-2, \mathrm{~m}(G)\}, \quad \mathrm{m}(G) \leq \max \left\{\mathrm{r}^{*}(G)-1, \mathrm{~K}(G)-1\right\}$. If $G$ is a p-group, then $\mathrm{m}(G)=\mathrm{r}(G)-1$, and thus

$$
\max \Delta^{*}(G)=\max \{\exp (G)-2, \mathrm{r}(G)-1\}
$$

Proof. See [31, Theorem 3.1, Lemma 3.3(4), and Proposition 3.6].
Lemma 2.5. Let $G$ be a finite abelian group and $G_{0} \subset G$ a subset.
(1) The following statements are equivalent:
(a) $G_{0}$ is decomposable.
(b) There are nonempty subsets $G_{1}, G_{2} \subset G_{0}$ such that $G_{0}=G_{1} \uplus G_{2}$ and $\mathcal{B}\left(G_{0}\right)=\mathcal{B}\left(G_{1}\right) \times \mathcal{B}\left(G_{2}\right)$.
(c) There are nonempty $G_{1}, G_{2} \subset G_{0}$ such that $G_{0}=G_{1} \uplus G_{2}$ and $\mathcal{A}\left(G_{0}\right)=\mathcal{A}\left(G_{1}\right) \uplus \mathcal{A}\left(G_{2}\right)$.
(d) There are nonempty $G_{1}, G_{2} \subset G_{0}$ such that $\left\langle G_{0}\right\rangle=\left\langle G_{1}\right\rangle \oplus\left\langle G_{2}\right\rangle$.
(2) If $G_{0}$ is minimal non-half-factorial, then $G_{0}$ is indecomposable.

Proof. (1) See [26, Lemma 3.7] and [1, Lemma 3.2].
(2) This follows immediately from (1)(b).

We will use the following simple fact throughout. For every subset $G_{0}$ in $G$ and every $g \in G_{0}$, we have

$$
\begin{align*}
& \operatorname{gcd}\left(\left\{\mathrm{v}_{g}(B) \mid B \in \mathcal{B}\left(G_{0}\right)\right\}\right)=\operatorname{gcd}\left(\left\{\mathrm{v}_{g}(A) \mid A \in \mathcal{A}\left(G_{0}\right)\right\}\right)  \tag{2.1}\\
& =\min \left(\left\{\mathrm{v}_{g}(A) \mid \mathrm{v}_{g}(A)>0, A \in \mathcal{A}\left(G_{0}\right)\right\}\right) \\
& =\min \left(\left\{\mathrm{v}_{g}(B) \mid \mathrm{v}_{g}(B)>0, B \in \mathcal{B}\left(G_{0}\right)\right\}\right) \\
& =\min \left(\left\{k \in \mathbb{N} \mid k g \in\left\langle G_{0} \backslash\{g\}\right\rangle\right\}\right)=\operatorname{gcd}\left(\left\{k \in \mathbb{N} \mid k g \in\left\langle G_{0} \backslash\{g\}\right\rangle\right\}\right)
\end{align*}
$$

In particular, $\min \left(\left\{k \in \mathbb{N} \mid k g \in\left\langle G_{0} \backslash\{g\}\right\rangle\right\}\right)$ divides ord $(g)$.

Lemma 2.6. Let $G$ be a finite abelian group and $G_{0} \subset G$ a subset.
(1) Suppose that for any distinct $h, h^{\prime} \in G_{0}$ we have $h \notin\left\langle G_{0} \backslash\left\{h, h^{\prime}\right\}\right\rangle$. Then for any atom $A$ with $\operatorname{supp}(A) \subsetneq G_{0}$ and any $h \in \operatorname{supp}(A)$, we have $\operatorname{gcd}\left(\mathrm{v}_{h}(A), \operatorname{ord}(h)\right)>1$.
(2) If $G_{0}$ is minimal non-half-factorial, then there exists a minimal non-half-factorial subset $G_{0}^{*} \subset G$ with $\left|G_{0}\right|=\left|G_{0}^{*}\right|$ and a transfer homomorphism $\theta: \mathcal{B}\left(G_{0}\right) \rightarrow \mathcal{B}\left(G_{0}^{*}\right)$ such that:
(a) For each $g \in G_{0}^{*}$, we have $g \in\left\langle G_{0}^{*} \backslash\{g\}\right\rangle$.
(b) For each $B \in \mathcal{B}\left(G_{0}\right)$, we have $\mathrm{k}(B)=\mathrm{k}(\theta(B))$.
(c) If $G_{0}^{*}$ has the property that for each $h \in G_{0}^{*}, h \notin\langle E\rangle$ for any $E \subsetneq G_{0}^{*} \backslash\{h\}$, then $G_{0}$ also has this property.
(d) If $G_{0}^{*}$ has the property that there exists $h \in G_{0}^{*}$ such that $G_{0}^{*} \backslash\{h\}$ is independent, then $G_{0}$ also has this property.

Proof. (1) Assume to the contrary that there are $A$ and $h$ as above such that $\operatorname{gcd}\left(\mathrm{v}_{h}(A), \operatorname{ord}(h)\right)=1$. Choose $h^{\prime} \in G_{0} \backslash \operatorname{supp}(A)$; then $h \in$ $\langle\operatorname{supp}(A) \backslash\{h\}\rangle \subset\left\langle G_{0} \backslash\left\{h, h^{\prime}\right\}\right\rangle$, a contradiction.
(2) By [13, Theorem 6.7.11], there are a subset $G_{0}^{*} \subset G$ satisfying property (a) and a transfer homomorphism $\theta: \mathcal{B}\left(G_{0}\right) \rightarrow \mathcal{B}\left(G_{0}^{*}\right)$. Moreover, $\theta$ is a composition of transfer homomorphisms $\theta^{\prime}$ of the following form:

- Let $g \in G_{0}, m=\min \left\{k \in \mathbb{N} \mid k g \in\left\langle G_{0} \backslash\{g\}\right\rangle\right\}, G_{0}^{\prime}=G_{0} \backslash(\{g\} \cup\{m g\})$, and define

$$
\theta^{\prime}: \mathcal{B}\left(G_{0}\right) \rightarrow \mathcal{B}\left(G_{0}^{\prime}\right), \quad \theta^{\prime}(B)=g^{-\mathrm{v}_{g}(B)}(m g)^{\mathrm{v}_{g}(B) / m} B
$$

It is shown in [13] that $m \mid \mathrm{v}_{g}(B)$ and $m \mid \operatorname{ord}(g)$.
Therefore it is sufficient to show that $\left|G_{0}\right|=\left|G_{0}^{\prime}\right|$ and that $\theta^{\prime}$ satisfies properties (b)-(d).
(i) By definition, we have $\mathrm{k}(B)=\mathrm{k}\left(\theta^{\prime}(B)\right)$ for all $B \in \mathcal{B}\left(G_{0}\right)$.
(ii) Since $G_{0}$ is a minimal non-half-factorial set, the same is true for $G_{0}^{\prime}$ by [13, Lemma 6.8.9]. If $m g \in G_{0} \backslash\{g\}$, then $G_{0}^{\prime} \subsetneq G_{0}$ would be non-halffactorial, contrary to the minimality of $G_{0}$. Hence $m g \notin G_{0} \backslash\{g\}$, which implies that $\left|G_{0}^{\prime}\right|=\left|G_{0}\right|$.
(iii) We set $G_{0}=\left\{g=g_{1}, \ldots, g_{k}\right\}$ (note that $k \geq 2$ ), $G_{0}^{\prime}=\left\{m g, g_{2}, \ldots, g_{k}\right\}$, and suppose that $h \notin\langle E\rangle$ for each $h \in G_{0}^{\prime}$ and for any $E \subsetneq G_{0}^{\prime} \backslash\{h\}$. Assume to the contrary that there exist $h \in G_{0}$ and $E \subsetneq G_{0} \backslash\{h\}$ such that $h \in\langle E\rangle$. If $h=g$, then $m g \in\langle E\rangle$, a contradiction.

Suppose that $h \neq g$, say $h=g_{k} \in\langle E\rangle$ with $E \subsetneq\left\{g, g_{2}, \ldots, g_{k-1}\right\}$. If $g \notin E$, then $E \subsetneq G_{0}^{\prime} \backslash\{m g\}$, a contradiction. Thus $g \in E$, and we set $E^{\prime}=E \backslash\{g\} \cup\{m g\}$. Since $h \in\langle E\rangle$, we have $h=\sum_{x \in E \backslash\{g\}} t_{x} x+t g$ where $t_{x}, t \in \mathbb{Z}$. Thus $t g=h-\sum_{x \in E \backslash\{g\}} t_{x} x \in\langle E \cup\{h\} \backslash\{g\}\rangle \subset\left\langle G_{0} \backslash\{g\}\right\rangle$.

By (2.1), we deduce that $m \mid t$ and hence $h=\sum_{x \in E \backslash\{g\}} t_{x} x+\frac{t}{m} m g \in\left\langle E^{\prime}\right\rangle$, a contradiction.
(iv) We set $G_{0}=\left\{g=g_{1}, \ldots, g_{k}\right\}, G_{0}^{\prime}=\left\{m g, g_{2}, \ldots, g_{k}\right\}$, and suppose that there exists $h \in G_{0}^{\prime}$ such that $G_{0}^{\prime} \backslash\{h\}$ is independent. If $h=m g$, then $G_{0} \backslash\{g\}=G_{0}^{\prime} \backslash\{h\}$ is independent. Suppose that $h \neq m g$, say $h=g_{k}$. Then $\left\{m g, g_{2}, \ldots, g_{k-1}\right\}$ is independent and assume to the contrary that $G_{0} \backslash\{h\}$ $=\left\{g, g_{2}, \ldots, g_{k-1}\right\}$ is not independent. Then there exist $t_{1}, \ldots, t_{k-1} \in \mathbb{Z}$ such that $t_{1} g+t_{2} g_{2}+\cdots+t_{k-1} g_{k-1}=0$ but $t_{i} g_{i} \neq 0$ for at least one $i \in[1, k-1]$. This implies that $t_{1} g \in\left\langle g_{2}, \ldots, g_{k-1}\right\rangle \subset\left\langle G_{0} \backslash\{g\}\right\rangle$. By (1), we infer that $m \mid t_{1}$ and hence $\frac{t_{1}}{m} m g+t_{2} g_{2}+\cdots+t_{k-1} g_{k-1}=0$, contrary to $\left\{m g, g_{2}, \ldots, g_{k-1}\right\}$ being independent.

## 3. Direct results on $\Delta^{*}(H)$

Lemma 3.1. Let $G$ be a finite abelian group and $G_{0} \subset G$ a subset with $\left|G_{0}\right| \geq \mathrm{r}(G)+2$ such that:
(a) For each $h \in G_{0}, G_{0} \backslash\{h\}$ is half-factorial and $h \notin\left\langle G_{0} \backslash\left\{h, h^{\prime}\right\}\right\rangle$ for any $h^{\prime} \in G_{0} \backslash\{h\}$.
(b) There exists $g \in G_{0}$ such that $g \in\left\langle G_{0} \backslash\{g\}\right\rangle$ and $\operatorname{ord}(g)$ is not a prime power.

Then $\left|G_{0}\right| \leq \exp (G)-2$.
Proof. We set $\exp (G)=n=p_{1}^{k_{1}} \cdot \ldots \cdot p_{t}^{k_{t}}$, where $t \geq 2, k_{1}, \ldots, k_{t} \in \mathbb{N}$ and $p_{1}, \ldots, p_{t}$ are distinct primes. By Lemma 2.6(1), we know that for any atom $A$ with $\operatorname{supp}(A) \subsetneq G_{0}$ and any $h \in \operatorname{supp}(A)$, we have $\operatorname{gcd}\left(\mathrm{v}_{h}(A), \operatorname{ord}(h)\right)>1$. In particular,

$$
\begin{equation*}
\mathrm{v}_{h}(A) \geq 2 \quad \text { for each } h \in \operatorname{supp}(A) \tag{3.1}
\end{equation*}
$$

We assert the following:
A. For each $\nu \in[1, t]$ with $p_{\nu} \mid \operatorname{ord}(g)$, there is an atom $U_{\nu} \in \mathcal{A}\left(G_{0}\right)$ such that $\mathrm{v}_{g}\left(U_{\nu}\right) \mid n / p_{\nu}^{k_{\nu}}, \mathrm{k}\left(U_{\nu}\right)=1, \operatorname{supp}\left(U_{\nu}\right) \subsetneq G_{0}$, and

$$
\left|\operatorname{supp}\left(U_{\nu}\right) \backslash\{g\}\right| \leq\left(n-\mathrm{v}_{g}\left(U_{\nu}\right)\right) / 2
$$

Proof of A. Let $\nu \in[1, t]$ with $p_{\nu} \mid \operatorname{ord}(g)$. Since $g \in\left\langle G_{0} \backslash\{g\}\right\rangle$ and $t \geq 2$, it follows that $0 \neq\left(n / p_{\nu}^{k_{\nu}}\right) g \in G_{\nu}=\left\langle\left(n / p_{\nu}^{k_{\nu}}\right) h \mid h \in G_{0} \backslash\{g\}\right\rangle$. Obviously, $G_{\nu}$ is a $p_{\nu}$-group. Let $E_{\nu} \subset G_{0} \backslash\{g\}$ be minimal such that $\left(n / p_{\nu}^{k_{\nu}}\right) g \in\left\langle\left(n / p_{\nu}^{k_{\nu}}\right) E_{\nu}\right\rangle$. The minimality implies that $\left|E_{\nu}\right|=\left|\left(n / p_{\nu}^{k_{\nu}}\right) E_{\nu}\right|$ and $\left(n / p_{\nu}^{k_{\nu}}\right) E_{\nu}$ is a minimal generating set of $G_{\nu}^{\prime}:=\left\langle\left(n / p_{\nu}^{k_{\nu}}\right) E_{\nu}\right\rangle$. Thus [13, Lemma A.6.2] implies that $\left|\left(n / p_{\nu}^{k_{\nu}}\right) E_{\nu}\right| \leq \mathrm{r}^{*}\left(G_{\nu}^{\prime}\right)$. Putting all together we obtain

$$
\left|E_{\nu}\right|=\left|\frac{n}{p_{\nu}^{k_{\nu}}} E_{\nu}\right| \leq \mathrm{r}^{*}\left(G_{\nu}^{\prime}\right)=\mathrm{r}\left(G_{\nu}^{\prime}\right) \leq \mathrm{r}(G)
$$

Let $d_{\nu} \in \mathbb{N}$ be minimal such that $d_{\nu} g \in\left\langle E_{\nu}\right\rangle$. By 2.1), $d_{\nu} \mid n / p_{\nu}^{k_{\nu}}$ and there exists an atom $U_{\nu}$ such that $\mathrm{v}_{g}\left(U_{\nu}\right)=d_{\nu}$ and $\left|\operatorname{supp}\left(U_{\nu}\right)\right| \leq\left|E_{\nu}\right|+1 \leq$ $\mathrm{r}(G)+1 \leq\left|G_{0}\right|-1$, whence $\operatorname{supp}\left(U_{\nu}\right) \subsetneq G_{0}$. Thus property (a) implies that $\mathrm{k}\left(U_{\nu}\right)=1$. Let

$$
U_{\nu}=g^{\mathrm{v}_{g}\left(U_{\nu}\right)} \prod_{h \in \operatorname{supp}\left(U_{\nu}\right) \backslash\{g\}} h^{\mathrm{v}_{h}\left(U_{\nu}\right)} .
$$

Since $\mathrm{v}_{h}\left(U_{\nu}\right) \geq 2$ for each $h \in \operatorname{supp}\left(U_{\nu}\right) \backslash\{g\}$ by 3.1), it follows that

$$
1=\mathrm{k}\left(U_{\nu}\right) \geq \frac{\mathrm{v}_{g}\left(U_{\nu}\right)}{n}+\left|\operatorname{supp}\left(U_{\nu}\right) \backslash\{g\}\right| \frac{2}{n},
$$

whence $\left|\operatorname{supp}\left(U_{\nu}\right) \backslash\{g\}\right| \leq\left(n-\mathrm{v}_{g}\left(U_{\nu}\right)\right) / 2 . \operatorname{CProof}$ of $\mathbf{A}$
Let $s \in \mathbb{N}$ be minimal such that there exists a nonempty subset $E \subsetneq$ $G_{0} \backslash\{g\}$ with $s g \in\langle E\rangle$; suppose $E$ is a minimal such set. By (2.1), there is an atom $V$ with $\vee_{g}(V)=s$ and $\operatorname{supp}(V)=\{g\} \cup E \subsetneq G_{0}$. Then

$$
1=\mathrm{k}(V)=\frac{s}{\operatorname{ord}(g)}+\sum_{h \in E} \frac{\mathrm{v}_{h}(V)}{\operatorname{ord}(h)}
$$

By (3.1), we have $\mathrm{v}_{h}(V) \geq 2$ for each $h \in E$, and hence the equation above implies that $|E| \leq(n-s) / 2$.

CASE 1: $s$ is a power of a prime, say a power of $p_{1}$. Let $E_{1}=\operatorname{supp}\left(U_{1}\right) \backslash\{g\}$. Since $\mathrm{v}_{g}\left(U_{1}\right) \mid n / p_{1}^{k_{1}}$, we have $g \in\left\langle s g, \mathrm{v}_{g}\left(U_{1}\right) g\right\rangle \subset\left\langle E \cup E_{1}\right\rangle$. Property (a) implies that $E \cup E_{1}=G_{0} \backslash\{g\}$, and thus

$$
\left|G_{0}\right| \leq 1+|E|+\left|E_{1}\right| \leq 1+\frac{n-s}{2}+\frac{n-\mathrm{v}_{g}\left(U_{1}\right)}{2}=1+n-\frac{\mathrm{v}_{g}\left(U_{1}\right)+s}{2}
$$

Since $\operatorname{gcd}\left(\mathrm{v}_{g}\left(U_{1}\right), s\right)=1$, it follows that $\mathrm{v}_{g}\left(U_{1}\right)+s \geq 5$, hence $\left|G_{0}\right| \leq n-3 / 2$, and thus $\left|G_{0}\right| \leq n-2$.

CASE 2: $s$ is not a prime power, say $p_{1} p_{2} \mid s$. Then $s \geq 6$. Let $d=$ $\operatorname{gcd}\left(s, \mathrm{v}_{g}\left(U_{1}\right)\right)$ and $E_{1}=\operatorname{supp}\left(U_{1}\right) \backslash\{g\}$. Then $d<s$ and $d g \in\left\langle s g, \mathrm{v}_{g}\left(U_{1}\right) g\right\rangle \subset$ $\left\langle E \cup E_{1}\right\rangle \subset\left\langle G_{0} \backslash\{g\}\right\rangle$. The minimality of $s$ implies that $E \cup E_{1}=G_{0} \backslash\{g\}$, and thus

$$
\begin{aligned}
\left|G_{0}\right| & \leq 1+|E|+\left|E_{1}\right| \leq 1+\frac{n-s}{2}+\frac{n-\mathrm{v}_{g}\left(U_{1}\right)}{2} \\
& =1+n-\frac{\mathrm{v}_{g}\left(U_{1}\right)+s}{2} \leq n-3
\end{aligned}
$$

Lemma 3.2. Let $G$ be a finite abelian group with $\exp (G)=n$. Let $G_{0} \subset G$ be a minimal non-half-factorial LCN-set, and suppose that there is a subset $G_{2} \subset G_{0}$ such that $\left\langle G_{2}\right\rangle=\left\langle G_{0}\right\rangle$ and $\left|G_{2}\right| \leq\left|G_{0}\right|-2$. Then $\min \Delta\left(G_{0}\right) \leq \max \{1, n-4\}$.

Proof. Assume to the contrary that $\min \Delta\left(G_{0}\right) \geq \max \{2, n-3\}$. By [27, Corollary 3.1], the existence of $G_{2}$ implies that $\mathrm{k}(U) \in \mathbb{N}$ for each $U \in \mathcal{A}\left(G_{0}\right)$
and

$$
\min \Delta\left(G_{0}\right) \mid \operatorname{gcd}\left(\left\{\mathrm{k}(A)-1 \mid A \in \mathcal{A}\left(G_{0}\right)\right\}\right)
$$

We set

$$
W_{1}=\left\{A \in \mathcal{A}\left(G_{0}\right) \mid \mathrm{k}(A)=1\right\}, \quad W_{2}=\left\{A \in \mathcal{A}\left(G_{0}\right) \mid \mathrm{k}(A)>1\right\}
$$

Then, for any $U_{1}, U_{2} \in W_{2}$,

$$
\begin{align*}
& \mathrm{k}\left(U_{1}\right) \geq \max \{3, n-2\} \quad \text { and } \\
& \text { either } \mathrm{k}\left(U_{1}\right)=\mathrm{k}\left(U_{2}\right) \text { or }\left|\mathrm{k}\left(U_{1}\right)-\mathrm{k}\left(U_{2}\right)\right| \geq \max \{2, n-3\} \tag{3.2}
\end{align*}
$$

We choose $U \in W_{2}$. Then $\operatorname{supp}(U)=G_{0}$, and we pick $g \in G_{0} \backslash G_{2}$. Then $g \in\left\langle G_{2}\right\rangle$ and, by (2.1), there is an atom $A$ with $\mathrm{v}_{g}(A)=1$ and $\operatorname{supp}(A) \subset G_{2} \cup\{g\} \subsetneq G_{0}$. This implies that $A \in W_{1}$, and

$$
U A^{\operatorname{ord}(g)-\mathrm{v}_{g}(U)}=g^{\operatorname{ord}(g)} S
$$

for some zero-sum sequence $S$ over $G$. Since $\operatorname{supp}(S)=G_{0} \backslash\{g\}$ and $G_{0}$ is minimal non-half-factorial, $S$ has a factorization into a product of atoms from $W_{1}$. Therefore, for each $U \in W_{2}$, there are $A_{1}, \ldots, A_{m} \in W_{1}$, where $m \leq \operatorname{ord}(g)-\mathrm{v}_{g}(U) \leq n-1$, such that $U A_{1} \cdot \ldots \cdot A_{m}$ can be factorized into a product of atoms from $W_{1}$.

We set

$$
W_{0}=\left\{A \in \mathcal{A}\left(G_{0}\right) \mid \mathrm{k}(A)=\min \left\{\mathrm{k}(B) \mid B \in W_{2}\right\}\right\} \subset W_{2}
$$

and we consider all tuples $\left(U, A_{1}, \ldots, A_{m}\right)$, where $U \in W_{0}$ and $A_{1}, \ldots, A_{m}$ $\in W_{1}$, such that $U A_{1} \ldots \cdot A_{m}$ can be factorized into a product of atoms from $W_{1}$. We fix one such tuple $\left(U, A_{1}, \ldots, A_{m}\right)$ with $m$ minimal possible. Note that $m \leq n-1$. Let

$$
\begin{equation*}
U A_{1} \cdot \ldots \cdot A_{m}=V_{1} \cdot \ldots \cdot V_{t} \quad \text { with } t \in \mathbb{N} \text { and } V_{1}, \ldots, V_{t} \in W_{1} \tag{3.3}
\end{equation*}
$$

We observe that $\mathrm{k}(U)=t-m$ and assert the following:
A1. For each $\nu \in[1, t]$, we have $V_{\nu} \nmid U A_{1} \cdot \ldots \cdot A_{m-1}$.
Proof of A1. Assume to the contrary that there is a $\nu \in[1, t]$, say $\nu=1$, with $V_{1} \mid U A_{1} \cdot \ldots \cdot A_{m-1}$. Then there are $l \in \mathbb{N}$ and $T_{1}, \ldots, T_{l} \in \mathcal{A}\left(G_{0}\right)$ such that

$$
U A_{1} \cdot \ldots \cdot A_{m-1}=V_{1} T_{1} \cdot \ldots \cdot T_{l} .
$$

By the minimality of $m$, there exists $\nu \in[1, l]$ such that $T_{\nu} \in W_{2}$, say $\nu=1$. Since

$$
\sum_{\nu=2}^{l} \mathrm{k}\left(T_{\nu}\right)=\mathrm{k}(U)+(m-1)-1-\mathrm{k}\left(T_{1}\right) \leq m-2 \leq n-3
$$

and $\mathrm{k}\left(T^{\prime}\right) \geq n-2$ for all $T^{\prime} \in W_{2}$, it follows that $T_{2}, \ldots, T_{l} \in W_{1}$, whence $l=1+\sum_{\nu=2}^{l} \mathrm{k}\left(T_{\nu}\right) \leq m-1$. We obtain

$$
V_{1} T_{1} \cdot \ldots \cdot T_{l} A_{m}=U A_{1} \cdot \ldots \cdot A_{m}=V_{1} \cdot \ldots \cdot V_{t}
$$

and thus

$$
T_{1} \cdot \ldots \cdot T_{l} A_{m}=V_{2} \cdot \ldots \cdot V_{t}
$$

The minimality of $m$ implies that $\mathrm{k}\left(T_{1}\right)>\mathrm{k}(U)$. It follows that $\mathrm{k}\left(T_{1}\right)-\mathrm{k}(U)=m-1-l \leq m-2 \leq n-3 \leq \max \{n-3,2\} \leq \mathrm{k}\left(T_{1}\right)-\mathrm{k}(U)$. Therefore $l=1, m=n-1, n \geq 5$, and $\mathrm{k}\left(T_{1}\right)=\mathrm{k}(U)+n-3$. Thus

$$
T_{1} A_{n-1}=V_{2} \cdot \ldots \cdot V_{t}, \quad \text { and hence } \quad t-1 \leq\left|A_{n-1}\right|
$$

This equation shows that $\mathrm{k}\left(T_{1}\right)=t-2 \leq\left|A_{n-1}\right|-1 \leq n-1$, and hence $n-2 \leq \mathrm{k}(U)=\mathrm{k}\left(T_{1}\right)-n+3 \leq 2$, contradicting $n \geq 5$. Proof of A1

Since $\exp (G)=n$ and $\mathrm{k}\left(A_{m}\right)=1$, it follows that $\left|A_{m}\right| \leq n$. By A1, for each $\nu \in[1, t]$ there exists $h_{\nu} \in \operatorname{supp}\left(A_{m}\right)$ such that

$$
\mathrm{v}_{h_{\nu}}\left(V_{\nu}\right)>\mathrm{v}_{h_{\nu}}\left(U A_{1} \cdot \ldots \cdot A_{m-1}\right)
$$

For each $h \in \operatorname{supp}\left(A_{m}\right)$ we define

$$
F_{h}=\left\{\nu \in[1, t] \mid \mathrm{v}_{h}\left(V_{\nu}\right)>\mathrm{v}_{h}\left(U A_{1} \cdot \ldots \cdot A_{m-1}\right)\right\} \subset[1, t] .
$$

Thus

$$
\bigcup_{h \in \operatorname{supp}\left(A_{m}\right)} F_{h}=[1, t]
$$

and for each $h \in \operatorname{supp}\left(A_{m}\right)$, we have

$$
\begin{aligned}
\mathrm{v}_{h}\left(A_{m}\right)+\mathrm{v}_{h}\left(U A_{1} \cdot \ldots \cdot A_{m-1}\right) & =\sum_{i=1}^{t} \mathrm{v}_{h}\left(V_{i}\right) \geq \sum_{i \in F_{h}} \mathrm{v}_{h}\left(V_{i}\right) \\
& \geq\left|F_{h}\right|\left(\mathrm{v}_{h}\left(U A_{1} \cdot \ldots \cdot A_{m-1}\right)+1\right)
\end{aligned}
$$

Since $\left|A_{m}\right|>\left|\operatorname{supp}\left(A_{m}\right)\right|$ (otherwise $A_{m} \mid U$, a contradiction), we obtain

$$
\begin{aligned}
t & =\left|\bigcup_{h \in \operatorname{supp}\left(A_{m}\right)} F_{h}\right| \leq \sum_{h \in \operatorname{supp}\left(A_{m}\right)}\left|F_{h}\right| \\
& \leq \sum_{h \in \operatorname{supp}\left(A_{m}\right)} \frac{\mathrm{v}_{h}\left(A_{m}\right)+\mathrm{v}_{h}\left(U A_{1} \cdot \ldots \cdot A_{m-1}\right)}{\mathrm{v}_{h}\left(U A_{1} \cdot \ldots \cdot A_{m-1}\right)+1} \\
& \leq \sum_{h \in \operatorname{supp}\left(A_{m}\right)} \frac{\mathrm{v}_{h}\left(A_{m}\right)+1}{2}=\frac{\left|A_{m}\right|}{2}+\frac{\left|\operatorname{supp}\left(A_{m}\right)\right|}{2}<\left|A_{m}\right| \leq n .
\end{aligned}
$$

By (3.3) and (3.2), we have $\max \{3, n-2\} \leq \mathrm{k}(U)=t-m \leq n-1-m$ and hence $m=1, n \geq 5, t=n-1$, and $\mathrm{k}(U)=n-2$. Therefore

$$
\begin{equation*}
U A_{1}=V_{1} \cdot \ldots \cdot V_{n-1}, \quad\left|A_{1}\right|=n, \quad n-2 \leq\left|\operatorname{supp}\left(A_{1}\right)\right| \leq n-1 \tag{3.4}
\end{equation*}
$$

and

$$
\begin{equation*}
\sum_{h \in \operatorname{supp}\left(A_{1}\right)}\left|F_{h}\right|=n-1, \quad \text { with } F_{h}, h \in \operatorname{supp}\left(A_{1}\right), \text { pairwise disjoint. } \tag{3.5}
\end{equation*}
$$

Furthermore, $\left|F_{h}\right| \leq \frac{\mathrm{v}_{h}\left(A_{1}\right)+\mathrm{v}_{h}(U)}{\mathrm{v}_{h}(U)+1}$ for all $h \in \operatorname{supp}\left(A_{1}\right)$. Then for $h \in$ $\operatorname{supp}\left(A_{1}\right)$,

$$
\begin{equation*}
\left|F_{h}\right| \leq 1 \quad \text { when } \mathrm{v}_{h}\left(A_{1}\right) \leq 2, \quad\left|F_{h}\right| \leq 2 \quad \text { when } \mathrm{v}_{h}\left(A_{1}\right) \leq 4 \tag{3.6}
\end{equation*}
$$

Now we consider all atoms $A_{1} \in W_{1}$ such that $U A_{1}$ can be factorized into a product of $n-1$ atoms from $W_{1}$, and among them we consider the atoms $A_{1}^{\prime}$ for which $\left|\operatorname{supp}\left(A_{1}^{\prime}\right)\right|$ is minimal; from these we choose an atom $A_{1}^{\prime \prime}$ for which $\mathrm{h}\left(A_{1}^{\prime \prime}\right)$ is minimal. Changing notation if necessary we suppose that $A_{1}$ has this property. By $(\sqrt[3.4]{ })$, we distinguish three cases depending on $\left|\operatorname{supp}\left(A_{1}\right)\right|$ and $\mathrm{h}\left(A_{1}\right)$.

CASE 1: $\left|\operatorname{supp}\left(A_{1}\right)\right|=n-1$. Let $\operatorname{supp}\left(A_{1}\right)=\left\{g_{1}, \ldots, g_{n-1}\right\}$ and $A_{1}=$ $g_{1}^{2} g_{2} \cdot \ldots \cdot g_{n-1}$. Since $h\left(A_{1}\right)=2,(3.6)$ and (3.5) imply that $\left|F_{h}\right|=1$ for each $h \in \operatorname{supp}\left(A_{1}\right)$. Note that $U g_{1}^{2} g_{2} \cdot \ldots \cdot g_{n-1}=V_{1} \cdot \ldots \cdot V_{n-1}$. After renumbering if necessary we may suppose that $F_{g_{i}}=\{i\}$ for each $i \in[1, n-1]$. Therefore $\mathrm{v}_{g_{i}}\left(V_{i}\right)>\mathrm{v}_{g_{i}}(U) \geq 1$ for each $i \in[1, n-1]$. Hence $\mathrm{v}_{g_{1}}\left(V_{1}\right) \geq 2$ and we set $V_{1}=g_{1}^{2} Y_{1}$ for some $Y_{1}$ dividing $U$. Thus $U Y_{1}^{-1} g_{2} \cdot \ldots \cdot g_{n-1}=V_{2} \cdot \ldots \cdot V_{n-1}$, which implies that $V_{i}=g_{i} Y_{i}$ for $i \in[2, n-1]$, where $Y_{2} \cdot \ldots \cdot Y_{n-1}=U Y_{1}^{-1}$. Summing up we have
(3.7) $U=Y_{1} \cdot \ldots \cdot Y_{n-1}$ with $V_{i}=g_{i} Y_{i}$ for $i \in[2, n-1]$ and $V_{1}=g_{1}^{2} Y_{1}$.

Since $\mathrm{k}\left(A_{1}^{\lfloor(n+1) / 2\rfloor} g_{1}^{-n}\right)=\lfloor(n+1) / 2\rfloor \mathrm{k}\left(A_{1}\right)-1=\lfloor(n+1) / 2\rfloor-1<$ $\max \{3, n-2\}$, it follows that every atom $X$ dividing $A_{1}^{\lfloor(n+1) / 2\rfloor} g_{1}^{-n}$ has cross number $\mathrm{k}(X)=1$ by $(3.2)$. Since $\mathrm{v}_{g_{1}}\left(A_{1}^{\lfloor(n+1) / 2\rfloor} g_{1}^{-n}\right) \leq 1$, there is an atom $C$ dividing $A_{1}^{\lfloor(n+1) / 2\rfloor} g_{1}^{-n}$ with $\operatorname{supp}(C) \subset\left\{g_{2}, \ldots, g_{n-1}\right\}$ and $|\operatorname{supp}(C)| \geq 2$, say $g_{2}, g_{3} \in \operatorname{supp}(C)$. Therefore, $V_{2} V_{3}=g_{2} g_{3} Y_{2} Y_{3} \mid U C$, say $U C=V_{2} V_{3} V^{\prime}$ for some $V^{\prime} \in \mathcal{B}(G)$. Since

$$
\mathrm{k}(U C)=\mathrm{k}(U)+\mathrm{k}(C)=n-1=\mathrm{k}\left(V_{2}\right)+\mathrm{k}\left(V_{3}\right)+\mathrm{k}\left(V^{\prime}\right),
$$

we obtain $\mathrm{k}\left(V^{\prime}\right)=n-3$. Now (3.2) implies that $V^{\prime}$ is a product of atoms from $W_{1}$, and hence $U C$ can be factorized into a product of $n-1$ atoms. Since $|\operatorname{supp}(C)|<n-1=\left|\operatorname{supp}\left(A_{1}\right)\right|$, this contradicts the choice of $A_{1}$.

CASE 2: $\left|\operatorname{supp}\left(A_{1}\right)\right|=n-2$ and $\mathrm{h}\left(A_{1}\right)=2$. Let $\operatorname{supp}\left(A_{1}\right)=\left\{g_{1}, \ldots, g_{n-2}\right\}$ and $A_{1}=g_{1}^{2} g_{2}^{2} g_{3} \cdot \ldots \cdot g_{n-2}$. Since $\mathrm{h}\left(A_{1}\right)=2$, (3.6) implies that $\left|F_{h}\right| \leq 1$ for each $h \in \operatorname{supp}\left(A_{1}\right)$. Thus $\sum_{h \in \operatorname{supp}\left(A_{1}\right)}\left|F_{h}\right| \leq n-2$, contrary to 3.5.

CASE 3: $\left|\operatorname{supp}\left(A_{1}\right)\right|=n-2$ and $\mathrm{h}\left(A_{1}\right)=3$. Let $\operatorname{supp}\left(A_{1}\right)=\left\{g_{1}, \ldots, g_{n-2}\right\}$ and $A_{1}=g_{1}^{3} g_{2} \cdots \cdot g_{n-2}$. Since $\mathrm{h}\left(A_{1}\right)=3$, 3.6) and (3.5) imply that $\left|F_{g_{1}}\right|=2$ and $\left|F_{g_{i}}\right|=1$ for each $i \in[2, n-2]$. Note that $U g_{1}^{3} g_{2} \cdot \ldots \cdot g_{n-2}=V_{1} \cdot \ldots \cdot V_{n-1}$. After renumbering if necessary we may suppose that $F_{g_{1}}=\{1, n-1\}$ and $F_{g_{i}}=\{i\}$ for each $i \in[2, n-2]$. Therefore $\mathrm{v}_{g_{i}}\left(V_{i}\right)>\mathrm{v}_{g_{i}}(U) \geq 1$ for each $i \in[1, n-2]$ and $\mathrm{v}_{g_{1}}\left(V_{n-1}\right)>\mathrm{v}_{g_{1}}(U) \geq 1$. Hence we may set $V_{n-1}=g_{1}^{2} Y_{n-1}$ for some $Y_{n-1}$ dividing $U$. Thus $U Y_{n-1}^{-1} g_{1} g_{2} \cdot \ldots \cdot g_{n-2}=V_{1} \cdot \ldots \cdot V_{n-2}$, which
implies that $V_{i}=g_{i} Y_{i}$ for each $i \in[1, n-2]$ where $Y_{1} \cdot \ldots \cdot Y_{n-2}=U Y_{n-1}^{-1}$. Summing up we have

$$
\begin{equation*}
U=Y_{1} \cdot \ldots \cdot Y_{n-1} \text { with } V_{i}=g_{i} Y_{i} \text { for } i \in[1, n-2] \text { and } V_{n-1}=g_{1}^{2} Y_{n-1} \tag{3.8}
\end{equation*}
$$

Since $\mathrm{k}\left(A_{1}^{\lfloor(n+2) / 3\rfloor} g_{1}^{-n}\right)=\lfloor(n+2) / 3\rfloor \mathrm{k}\left(A_{1}\right)-1=\lfloor(n+2) / 3\rfloor-1<$ $\max \{3, n-2\}$, it follows that every atom $X$ dividing $A_{1}^{\lfloor(n+2) / 3\rfloor} g_{1}^{-n}$ has $\mathrm{k}(X)=1$ by $(3.2)$. Let $C \in \mathcal{A}(G)$ divide $A_{1}^{\lfloor(n+2) / 3\rfloor} g_{1}^{-n}$. Then $\mathrm{k}(C)=1$, $\operatorname{supp}(C) \subset\left\{g_{1}, \ldots, g_{n-2}\right\}$, and $|\operatorname{supp}(C)| \geq 2$, say $g_{i}, g_{j} \in \operatorname{supp}(C)$ where $1 \leq i<j \leq n-2$. Therefore $V_{i} V_{j}=g_{i} g_{j} Y_{i} Y_{j} \mid U C$ by 3.8). Arguing as in Case 1 we infer that $U C$ is a product of $n-1$ atoms from $W_{1}$. By the choice of $A_{1}$, we obtain $|\operatorname{supp}(C)|=n-2$ and $\mathrm{h}(C) \geq 3$. This holds for all atoms dividing $A_{1}^{\lfloor(n+2) / 3\rfloor} g_{1}^{-n}$, contradicting the structure of $A_{1}^{\lfloor(n+2) / 3\rfloor}$.

Proof of Theorem 1.1. Let $H$ be a Krull monoid with class group $G$, and let $G_{P} \subset G$ denote the set of classes containing prime divisors. If $|G| \leq 2$, then $H$ is half-factorial by [13, Corollary 3.4.12], and thus $\Delta^{*}(H) \subset$ $\Delta(H)=\emptyset$. If $G$ is infinite and $G_{P}=G$, then $\Delta^{*}(H)=\mathbb{N}$ by [7, Theorem 1.1].

Suppose that $2<|G|<\infty$. By Lemma 2.1, it suffices to prove the statements for the Krull monoid $\mathcal{B}\left(G_{P}\right)$. If $G$ is finite, then $\Delta(G)$ is finite by [13, Corollary 3.4.13], hence $\Delta^{*}(G)$ is finite, and Lemma 2.3 shows that $\{\exp (G)-2, r(G)-1\} \subset \Delta^{*}(G)$.

Since $\Delta^{*}\left(G_{P}\right) \subset \Delta^{*}(G)$, it remains to prove that

$$
\max \Delta^{*}(G) \leq \max \{\exp (G)-2, r(G)-1\}
$$

Let $G_{0} \subset G$ be a non-half-factorial subset, $n=\exp (G)$, and $r=\mathrm{r}(G)$. We need to prove that $\min \Delta\left(G_{0}\right) \leq \max \{n-2, r-1\}$. If $G_{1} \subset G_{0}$ is non-halffactorial, then $\min \Delta\left(G_{0}\right)=\operatorname{gcd} \Delta\left(G_{0}\right) \mid \operatorname{gcd} \Delta\left(G_{1}\right)=\min \Delta\left(G_{1}\right)$. Thus we may suppose that $G_{0}$ is minimal non-half-factorial. If there is an $U \in \mathcal{A}\left(G_{0}\right)$ with $\mathrm{k}(U)<1$, then Lemma 2.3 .3 implies that $\min \Delta\left(G_{0}\right) \leq n-2$.

Suppose that $\mathrm{k}(U) \geq 1$ for all $U \in \mathcal{A}\left(G_{0}\right)$, i.e, $G_{0}$ is an LCN-set. Since $G_{0}$ is minimal non-half-factorial, it follows that $G_{0}$ is indecomposable by Lemma 2.5. By Lemma 2.6(2), we may suppose that $g \in\left\langle G_{0} \backslash\{g\}\right\rangle$ for all $g \in G_{0}$.

Suppose that the order of each element of $G_{0}$ is a prime power. Since $G_{0}$ is indecomposable, Lemma 2.5 implies that each order is a power of a fixed prime $p \in \mathbb{P}$, and thus $\left\langle G_{0}\right\rangle$ is a $p$-group. By Proposition 2.4 we infer that

$$
\begin{aligned}
\min \Delta\left(G_{0}\right) \leq \max \Delta^{*}\left(\left\langle G_{0}\right\rangle\right) & =\max \left\{\exp \left(\left\langle G_{0}\right\rangle\right)-2, r\left(\left\langle G_{0}\right\rangle\right)-1\right\} \\
& \leq \max \{n-2, r-1\}
\end{aligned}
$$

From now on we suppose that there is a $g \in G_{0}$ whose order is not a prime power. Then $n \geq 6$. If $\left|G_{0}\right| \leq r+1$, then $\min \Delta\left(G_{0}\right) \leq\left|G_{0}\right|-2 \leq r-1$
by Lemma 2.3 .3 . Thus we may suppose that $\left|G_{0}\right| \geq r+2$ and we distinguish two cases.

CASE 1: There exists a subset $G_{2} \subset G_{0}$ such that $\left\langle G_{2}\right\rangle=\left\langle G_{0}\right\rangle$ and $\left|G_{2}\right| \leq\left|G_{0}\right|-2$. Then Lemma 3.2 implies that $\min \Delta\left(G_{0}\right) \leq n-4 \leq n-2$.

CASE 2: Every subset $G_{1} \subset G_{0}$ with $\left|G_{1}\right|=\left|G_{0}\right|-1$ is a minimal generating set of $\left\langle G_{0}\right\rangle$. Then for each $h \in G_{0}, G_{0} \backslash\{h\}$ is half-factorial and $h \notin\left\langle G_{0} \backslash\left\{h, h^{\prime}\right\}\right\rangle$ for any $h^{\prime} \in G_{0} \backslash\{h\}$. Thus Lemma 3.1 implies that $\left|G_{0}\right| \leq n-2$, and hence $\min \Delta\left(G_{0}\right) \leq\left|G_{0}\right|-2 \leq n-4 \leq n-2$ by Lemma 2.3 (3).
4. Inverse results on $\Delta^{*}(H)$. Let $G$ be a finite abelian group. In this section we study the structure of minimal non-half-factorial subsets $G_{0} \subset G$ with $\min \Delta\left(G_{0}\right)=\max \Delta^{*}(G)$. These structural investigations were started by Schmid who obtained a characterization in case $\exp (G)-2>\mathrm{m}(G)$ (Lemma 4.1(1)). Our main result in this section is Theorem 4.5. All examples of minimal non-half-factorial subsets $G_{0} \subset G$ with $\min \Delta\left(G_{0}\right)=\max \Delta^{*}(G)$ known so far are simple (in the sense of Remark 4.6), and it has been conjectured that all such sets are simple. We provide the first example of a set $G_{0}$ which is not simple (Remark 4.6).

Lemma 4.1. Let $G$ be a finite abelian group with $|G|>2, \exp (G)=n$, $\mathrm{r}(G)=r$, and let $G_{0} \subset G$ be a subset with $\min \Delta\left(G_{0}\right)=\max \Delta^{*}(G)$.
(1) Suppose that $\mathrm{m}(G)<n-2$. Then $G_{0}$ is indecomposable if and only if $G_{0}=\{g,-g\}$ for some $g \in G$ with $\operatorname{ord}(g)=n$.
(2) Suppose that $r \leq n-1$. Then $G_{0}$ is minimal non-half-factorial but not an LCN-set if and only if $G_{0}=\{g,-g\}$ for some $g \in G$ with $\operatorname{ord}(g)=n$.

Proof. (1) See [30, Theorem 5.1].
(2) Since $n=2$ implies $r=1$ and $|G|=2$, it follows that $n \geq 3$. By Theorem1.1. we have min $\Delta\left(G_{0}\right)=n-2$. Obviously, the set $\{-g, g\}$, with $g \in G$ and $\operatorname{ord}(g)=n$, is a minimal non-half-factorial set with $\min \Delta(\{-g, g\})=$ $n-2$ but not an LCN-set.

Conversely, let $G_{0}$ be minimal non-half-factorial but not an LCN-set. Then there exists $A \in \mathcal{A}\left(G_{0}\right)$ with $\mathrm{k}(A)<1$. Since $\{n, n \mathrm{k}(A)\} \subset \mathrm{L}\left(A^{n}\right)$, it follows that $n-2 \mid n(\mathrm{k}(A)-1)$, whence $\mathrm{k}(A)=2 / n$. Consequently, $A=(-g) g$ for some $g$ with $\operatorname{ord}(g)=n$. Thus $\{-g, g\} \subset G_{0}$, and since $G_{0}$ is minimal non-half-factorial, equality follows.

Lemma 4.2. Let $G$ be a finite abelian group with $\exp (G)=n$ and $r(G)=r$.
(1) Let $G_{0} \subset G$ be a minimal non-half-factorial LCN-set with $\min \Delta\left(G_{0}\right)$ $=\max \Delta^{*}(G)$. Then $\left|G_{0}\right|=r+1, r \geq n-1$, and for any distinct $h, h^{\prime} \in G_{0}$ we have $h \notin\left\langle G_{0} \backslash\left\{h, h^{\prime}\right\}\right\rangle$.
(2) If $r \leq n-2$, then $\mathrm{m}(G) \leq n-3$.
(3) If $n \geq 5$ and $r \leq n-3$, then $\mathrm{m}(G) \leq n-4$.

Proof. (1) We have $\min \Delta\left(G_{0}\right) \leq\left|G_{0}\right|-2$ by Lemma 2.3 (3), and moreover $\min \Delta\left(G_{0}\right)=\max \{n-2, r-1\}$ by Theorem 1.1.

By Lemma 2.6(2) (properties (a) and (c)), we may assume that for each $g \in G_{0}$ we have $g \in\left\langle G_{0} \backslash\{g\}\right\rangle$.

CASE 1: There is a subset $G_{2} \subset G_{0}$ such that $\left\langle G_{2}\right\rangle=\left\langle G_{0}\right\rangle$ and $\left|G_{2}\right| \leq$ $\left|G_{0}\right|-2$. The existence of $G_{2}$ implies that $G$ is isomorphic neither to $C_{3}$ nor to $C_{2} \oplus C_{2}$ nor to $C_{3} \oplus C_{3}$ (this is clear for the first two groups; to exclude the case $C_{3} \oplus C_{3}$, use again [27, Corollary 3.1] which says that $\mathrm{k}(U) \in \mathbb{N}$ for each $\left.U \in \mathcal{A}\left(G_{0}\right)\right)$. By Lemma 3.2, we know that $\min \Delta\left(G_{0}\right) \leq \max \{n-4,1\}<$ $\max \{n-2, r-1\}=\min \Delta\left(G_{0}\right)$, a contradiction.

CASE 2: Every subset $G_{1} \subset G_{0}$ with $\left|G_{1}\right|=\left|G_{0}\right|-1$ is a minimal generating set of $\left\langle G_{0}\right\rangle$. Then for any distinct $h, h^{\prime} \in G_{0}$ we have $h \notin\left\langle G_{0} \backslash\left\{h, h^{\prime}\right\}\right\rangle$.

Assume to the contrary that $\left|G_{0}\right| \geq r+2$. Since $r+1 \leq\left|G_{0}\right|-1 \leq$ $r^{*}\left(\left\langle G_{0}\right\rangle\right)$, it follows by [13, Lemma A.6.2] that $\left\langle G_{0}\right\rangle$ is not a $p$-group. Since $G_{0}$ is a minimal non-half-factorial subset, there exists an atom $A$ with $\operatorname{supp}(A)$ $=G_{0}$ and hence $G_{0}$ contains an element whose order is not a prime power. Thus, by Lemma 3.1 we infer that $\left|G_{0}\right| \leq n-2$, and hence min $\Delta\left(G_{0}\right) \leq$ $\left|G_{0}\right|-2 \leq n-4$, a contradiction.

Therefore $\left|G_{0}\right| \leq r+1$. Then $\max \{n-2, r-1\}=\min \Delta\left(G_{0}\right) \leq\left|G_{0}\right|-2 \leq$ $r-1$, so we must have $\left|G_{0}\right|=r+1$ and $r \geq n-1$.
(2) Assume to the contrary that $r \leq n-2$ and $\mathrm{m}(G) \geq n-2$. Then by Theorem 1.1, $\max \Delta^{*}(G)=\max \{r-1, n-2\}=n-2$. Since $\mathrm{m}(G) \geq$ $n-2$, there is a minimal non-half-factorial LCN-set $G_{0}$ with $\min \Delta\left(G_{0}\right)=$ $\max \Delta^{*}(G)$, and then (1) implies that $r \geq n-1$, a contradiction.
(3) Let $G_{0} \subset G$ be a non-half-factorial LCN-subset. We need to prove that $\min \Delta\left(G_{0}\right) \leq n-4$. Without restriction we may suppose that $G_{0}$ is minimal non-half-factorial, which implies that $G_{0}$ is indecomposable by Lemma 2.5. By Lemma 2.6(2) we may suppose that for each $g \in G_{0}$ we have $g \in\left\langle G_{0} \backslash\{g\}\right\rangle$. Suppose that the order of each element of $G_{0}$ is a prime power. Since $G_{0}$ is indecomposable, Lemma 2.5 implies that each order is a power of a fixed prime $p \in \mathbb{P}$, and thus $\left\langle G_{0}\right\rangle$ is a $p$-group. By Proposition 2.4, we infer that

$$
\min \Delta\left(G_{0}\right) \leq \mathrm{m}\left(\left\langle G_{0}\right\rangle\right)=\mathrm{r}\left(\left\langle G_{0}\right\rangle\right)-1 \leq \mathrm{r}(G)-1 \leq n-4
$$

From now on we suppose that there is a $g \in G_{0}$ whose order is not a prime
power. If $\left|G_{0}\right| \leq n-2$, then $\min \Delta\left(G_{0}\right) \leq\left|G_{0}\right|-2 \leq n-4$ by Lemma 2.3 (3) Thus we may suppose that $\left|G_{0}\right| \geq n-1 \geq r+2$ and we distinguish two cases.

CASE 1: There exists a subset $G_{2} \subset G_{0}$ such that $\left\langle G_{2}\right\rangle=\left\langle G_{0}\right\rangle$ and $\left|G_{2}\right| \leq\left|G_{0}\right|-2$. Then Lemma 3.2 implies that $\min \Delta\left(G_{0}\right) \leq n-4$.

CASE 2: Every subset $G_{1} \subset G_{0}$ with $\left|G_{1}\right|=\left|G_{0}\right|-1$ is a minimal generating set of $\left\langle G_{0}\right\rangle$. Then for each $h \in G_{0}, G_{0} \backslash\{h\}$ is half-factorial and $h \notin\left\langle G_{0} \backslash\left\{h, h^{\prime}\right\}\right\rangle$ for any $h^{\prime} \in G_{0} \backslash\{h\}$. Thus Lemma 3.1 implies that $\left|G_{0}\right| \leq n-2$, a contradiction.

Lemma 4.3. Let $G$ be a finite abelian group with $\exp (G)=n$ and $\mathrm{r}(G)=r$, and let $G_{0} \subset G$ be a minimal non-half-factorial LCN-set with $\min \Delta\left(G_{0}\right)=\max \Delta^{*}(G)$.
(1) If $A \in \mathcal{A}\left(G_{0}\right)$ with $\mathrm{k}(A)=1$, then $|\operatorname{supp}(A)| \leq n / 2$.
(2) If $A \in \mathcal{A}\left(G_{0}\right)$ with $\mathrm{k}(A)>1$, then $\mathrm{k}(A)<r$ and $S A^{-1}$ is also an atom where $S=\prod_{g \in G_{0}} g^{\operatorname{ord}(g)}$.
Proof. By Lemma 4.2, we have $r \geq n-1,\left|G_{0}\right|=r+1$, and for each $h \in G_{0}, h \notin\left\langle G_{0} \backslash\left\{h, h^{\prime}\right\}\right\rangle$ for any $h^{\prime} \in G_{0} \backslash\{h\}$. Let $A \in \mathcal{A}\left(G_{0}\right)$.
(1) Since $\mathrm{k}(A)=1$, it follows that $|\operatorname{supp}(A)| \leq|A| \leq n$. Assume that $|\operatorname{supp}(A)|=n$. Then $\mathrm{v}_{g}(A)=1$ for each $g \in \operatorname{supp}(A)$. Since $G_{0}$ is a minimal non-half-factorial LCN-set, there is a $V \in \mathcal{A}\left(G_{0}\right)$ with $\mathrm{k}(V)>1$ and $\operatorname{supp}(V)=G_{0}$. Therefore $A \mid V$, a contradiction.

Thus $|\operatorname{supp}(A)| \leq n-1$, whence $\operatorname{supp}(A) \subsetneq G_{0}$. Therefore Lemma 2.6. 1 implies that $\operatorname{gcd}\left(\mathrm{v}_{g}(A), \operatorname{ord}(g)\right)>1$ for each $g \in \operatorname{supp}(A)$, and hence $|\operatorname{supp}(A)| \leq|A| / 2 \leq n / 2$.
(2) Let $A \in \mathcal{A}\left(G_{0}\right)$ with $\mathrm{k}(A)>1$. Then $A\left|S, r+1=\left|G_{0}\right|=\max \mathrm{L}(S)\right.$, and $\mathrm{L}(S) \backslash\{r+1\} \neq \emptyset$. By Theorem 1.1, we have $\min \Delta\left(G_{0}\right)=r-1$, hence $\mathrm{L}(S)=\{2, r+1\}$, and thus $S A^{-1}$ is an atom.

If $\mathrm{k}\left(S A^{-1}\right)=1$, then (1) implies that $\left|\operatorname{supp}\left(S A^{-1}\right)\right| \leq n / 2$, but on the other hand $\left|\operatorname{supp}\left(S A^{-1}\right)\right|=\left|G_{0}\right|=r+1 \geq n$, a contradiction.

Therefore $\mathrm{k}\left(S A^{-1}\right)>1$ and hence $r+1=\mathrm{k}(S)=\mathrm{k}(A)+\mathrm{k}\left(S A^{-1}\right)$ implies that $\mathrm{k}(A)<r$.

Lemma 4.4. Let $G$ be a finite abelian group with $\exp (G)=n$ and $\mathrm{r}(G)=r$, and let $G_{0} \subset G$ be a minimal non-half-factorial LCN-set with $\min \Delta\left(G_{0}\right)=\max \Delta^{*}(G)$. Let $g \in G_{0}$ with $g \in\left\langle G_{0} \backslash\{g\}\right\rangle$, and let $d \in$ $[1, \operatorname{ord}(g)]$ be minimal such that $d g \in\left\langle E^{*}\right\rangle$, where the minimum is taken over all subsets $E^{*} \subsetneq G_{0} \backslash\{g\}$. Then $d \mid \operatorname{ord}(g)$ and:
(1) Let $k \in[1, \operatorname{ord}(g)-1]$ with $d \nmid k$. Then there is an atom $A$ with $\mathrm{v}_{g}(A)=k$ and $\mathrm{k}(A)>1$. If $B \in \mathcal{B}\left(G_{0}\right)$ with $\mathrm{v}_{g}(B)=k$ and $B$ divides $\prod_{g \in G_{0}} g^{\operatorname{ord}(g)}$, then $B$ is an atom.
(2) If $A_{1}, A_{2}$ are atoms with $\mathrm{v}_{g}\left(A_{1}\right) \equiv \mathrm{v}_{g}\left(A_{2}\right) \bmod d$, then $\mathrm{k}\left(A_{1}\right)=$ $\mathrm{k}\left(A_{2}\right)$.
Proof. Lemma 4.2 yields $\left|G_{0}\right|=r+1$ and $r \geq n-1$. The minimality of $d$ and (2.1) imply that $d \mid \operatorname{ord}(g)$. We set $S=\prod_{h \in G_{0}} h^{\operatorname{ord}(h)}$.
(1) Since $g \in\left\langle G_{0} \backslash\{g\}\right\rangle$, there is a zero-sum sequence $B$ such that $\mathrm{v}_{g}(B)=k$, and we choose $B$ with minimal length $|B|$. Thus $B \mid S$, and it remains to prove that $B$ is an atom with $\mathrm{k}(B)>1$.

We set $B=A_{1} \cdot \ldots \cdot A_{s}$ with $s \in \mathbb{N}$ and atoms $A_{1}, \ldots, A_{s}$. Then $\mathrm{v}_{g}\left(A_{1}\right)+$ $\cdots+\mathrm{v}_{g}\left(A_{s}\right)=\mathrm{v}_{g}(B)=k$. Since $d \nmid k$, there is an $i \in[1, s]$ such that $d \nmid \mathrm{v}_{g}\left(A_{i}\right)$.

Assume to the contrary that $\mathrm{k}\left(A_{i}\right)=1$. Then $\left|\operatorname{supp}\left(A_{i}\right)\right| \leq n / 2$ by Lemma 4.3(1). By the definition of $d$, there exists an atom $A^{\prime}$ such that $\mathrm{v}_{g}\left(A^{\prime}\right)=d$ and $\mathrm{k}\left(A^{\prime}\right)=1$, which implies $\left|\operatorname{supp}\left(A^{\prime}\right)\right| \leq n / 2$ by Lemma 4.3(1). Hence $\operatorname{gcd}\left(d, \mathrm{v}_{g}\left(A_{i}\right)\right)<d, \operatorname{gcd}\left(d, \mathrm{v}_{g}\left(A_{i}\right)\right) g \in\left\langle\operatorname{supp}\left(A_{i}\right) \cup \operatorname{supp}\left(A^{\prime}\right) \backslash\{g\}\right\rangle$, and $\left|\operatorname{supp}\left(A_{i}\right) \cup \operatorname{supp}\left(A^{\prime}\right) \backslash\{g\}\right| \leq n-2<r<\left|G_{0}\right|$, contradicting the choice of $d$.

Thus $\mathrm{k}\left(A_{i}\right)>1$. Since $k \leq \operatorname{ord}(g)-1$, it follows that $S B^{-1} \neq 1$. Since $S A_{i}^{-1}=\left(S B^{-1}\right)\left(B A_{i}^{-1}\right)$ is an atom by Lemma 4.3(2), we infer that $B=A_{i}$ is an atom with $\mathrm{k}(B)>1$.
2. Let $A_{1} \in \mathcal{A}\left(G_{0}\right)$. We assert that $\mathrm{k}\left(A_{1}\right)=\mathrm{k}\left(A_{2}\right)$ for all $A_{2} \in \mathcal{A}\left(G_{0}\right)$ with $\mathrm{v}_{g}\left(A_{1}\right) \equiv \mathrm{v}_{g}\left(A_{2}\right) \bmod d$. We distinguish two cases.

CASE 1: $d \mid \mathrm{v}_{g}\left(A_{1}\right)$. There is an $A \in \mathcal{A}\left(G_{0}\right)$ with $\mathrm{v}_{g}(A)=d$ and $\mathrm{k}(A)=1$. It is sufficient to show that $\mathrm{k}\left(A_{1}\right)=1$. There are $l \in \mathbb{N}$ and $V_{1}, \ldots, V_{l} \in$ $\mathcal{A}\left(G_{0} \backslash\{g\}\right)$ (hence $\mathrm{k}\left(V_{1}\right)=\cdots=\mathrm{k}\left(V_{l}\right)=1$ ) such that
$A_{1} A^{\frac{\operatorname{ord}(g)-\mathrm{v}_{g}\left(A_{1}\right)}{d}}=g^{\operatorname{ord}(g)} V_{1} \cdot \ldots \cdot V_{l}, \quad$ so $\quad \mathrm{k}\left(A_{1}\right)=1+l-\frac{\operatorname{ord}(g)-\mathrm{v}_{g}\left(A_{1}\right)}{d}$.
Furthermore, $\min \Delta\left(G_{0}\right)=r-1$ divides

$$
(l+1)-\left(1+\frac{\operatorname{ord}(g)-\mathrm{v}_{g}\left(A_{1}\right)}{d}\right)=\mathrm{k}\left(A_{1}\right)-1 .
$$

Since $\mathrm{k}\left(A_{1}\right)<r$ by Lemma 4.3, it follows that $\mathrm{k}\left(A_{1}\right)=1$.
CASE 2: $d \nmid \mathrm{v}_{g}\left(A_{1}\right)$. Let $d_{0} \in[1, d-1]$ be such that $\mathrm{v}_{g}\left(A_{1}\right) \equiv d_{0} \bmod d$. By (1), there are atoms $B_{l}$ such that $\mathrm{v}_{g}\left(B_{l}\right)=d_{0}+l d$ for all $l \in \mathbb{N}_{0}$ with $d_{0}+l d<\operatorname{ord}(g)$. Thus by an inductive argument it is sufficient to prove the assertion for those atoms $A_{2}$ with $\mathrm{v}_{g}\left(A_{2}\right)=\mathrm{v}_{g}\left(A_{1}\right)$, and those with $\mathrm{v}_{g}\left(A_{2}\right)=\mathrm{v}_{g}\left(A_{1}\right)+d$.

Suppose that $\mathrm{v}_{g}\left(A_{1}\right)=\mathrm{v}_{g}\left(A_{2}\right)$. By (1), there is an atom $V$ such that $\mathrm{v}_{g}(V)=\operatorname{ord}(g)-\mathrm{v}_{g}\left(A_{1}\right)$ and $\mathrm{k}(V)>1$. Then there are $l \in \mathbb{N}$ and $V_{1}, \ldots, V_{l} \in$ $\mathcal{A}\left(G_{0} \backslash\{g\}\right)$ such that $A_{1} V=g^{\operatorname{ord}(g)} V_{1} \cdot \ldots \cdot V_{l}$, and hence $\mathrm{k}\left(A_{1}\right)+\mathrm{k}(V)=$ $1+\sum_{i=1}^{l} \mathrm{k}\left(V_{i}\right)=l+1$. Since $\mathrm{k}(V)>1$, we have $l>1$. Since $\min \Delta\left(G_{0}\right)=r-1$ divides $l-1$, either $l=r$ or $l \geq 2 r-1$. If $l \geq 2 r-1$, then $\mathrm{k}\left(A_{1}\right) \geq r$ or
$\mathrm{k}(V) \geq r$, contrary to Lemma 4.3. Therefore $\mathrm{k}\left(A_{1}\right)+\mathrm{k}(V)=r+1=$ $\mathrm{k}\left(A_{2}\right)+\mathrm{k}(V)$, and hence $\mathrm{k}\left(A_{1}\right)=\mathrm{k}\left(A_{2}\right)$.

Suppose that $\mathrm{v}_{g}\left(A_{1}\right)=\mathrm{v}_{g}\left(A_{2}\right)+d$. Let $E \subsetneq G_{0} \backslash\{g\}$ be such that $d g \in\langle E\rangle$. Then there is an $A \in \mathcal{A}(E \cup\{g\})$ with $\vee_{g}(A)=d$, and clearly $\mathrm{k}(A)=1$. Let $V_{1}, \ldots, V_{t}$ be all the atoms with $V_{\nu} \mid A_{2} A$ and $\left|\operatorname{supp}\left(V_{\nu}\right)\right|=1$ for all $\nu \in[1, t]$. Since $\mathrm{v}_{g}\left(A_{2} A\right)=\mathrm{v}_{g}\left(A_{1}\right)<\operatorname{ord}(g)$, it follows that $B=$ $A_{2} A\left(V_{1} \cdot \ldots \cdot V_{t}\right)^{-1}$ divides $S$ and that $\mathrm{v}_{g}(B)=\mathrm{v}_{g}\left(A_{1}\right)$. Therefore (2) implies that $B$ is an atom, and by Step 1 we obtain $\mathrm{k}(B)=\mathrm{k}\left(A_{1}\right)$.

If $t \geq 2$, then $A_{2} A=B V_{1} \cdot \ldots \cdot V_{t}$ implies $t \geq 1+\min \Delta\left(G_{0}\right)=r$, and thus $\mathrm{k}\left(A_{2}\right) \geq r$, contradicting Lemma 4.3. Therefore $t=1$, and thus $\mathrm{k}\left(A_{2}\right)+1=\mathrm{k}(B)+1=\mathrm{k}\left(A_{1}\right)+1$.

Theorem 4.5. Let $G$ be a finite abelian group with $\exp (G)=n$ and $\mathrm{r}(G)=r$, and let $G_{0} \subset G$ be a minimal non-half-factorial set with $\min \Delta\left(G_{0}\right)$ $=\max \Delta^{*}(G)$.
(1) If $r<n-1$, then there exists $g \in G$ with $\operatorname{ord}(g)=n$ such that $G_{0}=\{g,-g\}$.
(2) Let $r=n-1$. If $G_{0}$ is not an LCN-set, then there exists $g \in G$ with $\operatorname{ord}(g)=n$ such that $G_{0}=\{g,-g\}$. If $G_{0}$ is an LCN-set, then $\left|G_{0}\right|=$ $r+1$, and for any distinct $h, h^{\prime} \in G_{0}$ we have $h \notin\left\langle G_{0} \backslash\left\{h, h^{\prime}\right\}\right\rangle$.
(3) If $r \geq n$, then $G_{0}$ is an LCN-set with $\left|G_{0}\right|=r+1$, and for any distinct $h, h^{\prime} \in G_{0}$ we have $h \notin\left\langle G_{0} \backslash\left\{h, h^{\prime}\right\}\right\rangle$.
(4) If $r \geq n-1, G_{0}$ is an LCN-set, and $n$ is odd, then there exists $g \in G_{0}$ such that $G_{0} \backslash\{g\}$ is independent.

Proof. (1) Suppose that $r<n-1$. Then Lemma 4.2 implies that $G_{0}$ is not an LCN-set. Thus Lemma 4.1 (2) shows that $G_{0}$ has the asserted form.
(2) If $G_{0}$ is not an LCN-set, then the assertion follows from Lemma 4.1 (2); otherwise it follows from Lemma 4.2 (1).
(3) Suppose that $r \geq n$. Then Theorem 1.1 implies that $\min \Delta\left(G_{0}\right)=$ $\max \Delta^{*}(G)=r-1$. Thus Lemma $2.3(3)$ (a) shows that $G_{0}$ is an LCN-set. Hence the assertion follows from Lemma 4.2(1).
(4) Let $r \geq n-1, G_{0}$ be an LCN-set, and suppose that $n$ is odd. By Lemma 2.6 (2) (properties (a) and (d)), we may suppose without restriction that $g \in\left\langle G_{0} \backslash\{g\}\right\rangle$ for each $g \in G_{0}$. Lemma 4.2 implies that $\left|G_{0}\right|=r+1$ and for each $g \in G_{0}$ we have $g \notin\langle E\rangle$ for any $E \subsetneq G_{0} \backslash\{g\}$.

Assume to the contrary that $G_{0} \backslash\{h\}$ is dependent for each $h \in G_{0}$. Then there exist $g \in G_{0}, d \in[2, \operatorname{ord}(g)-1]$, and $E \subsetneq G_{0} \backslash\{g\}$ such that $d g \in\langle E\rangle$. Now let $d \in \mathbb{N}$ be minimal over all configurations $(g, E, d)$, and fix $g, E$ corresponding to $d$. It follows that we have an atom $A$ with $\operatorname{supp}(A) \subsetneq G_{0}$ and $\mathrm{v}_{g}(A)=d$. By Lemma 4.4, $d \mid \operatorname{ord}(g)$, and hence $d \geq 3$ because $n$ is odd.

Since $G_{0} \backslash\{g\}$ is dependent, there exists $U^{\prime} \in \mathcal{A}\left(G_{0} \backslash\{g\}\right)$ with $\left|\operatorname{supp}\left(U^{\prime}\right)\right|$ $>1$. Thus, by (2.1), there exist $U \in \mathcal{A}\left(G_{0} \backslash\{g\}\right)$ and $h \in \operatorname{supp}(U)$ such that $\mathrm{v}_{h}(U) \leq \operatorname{ord}(h) / 2$ and $\mathrm{v}_{h}(U) \mid \operatorname{ord}(h)$.

By Lemma 4.4(1), there are atoms $A_{1}, \ldots, A_{d-1}$ with $\mathrm{v}_{g}\left(A_{i}\right)=i$ and $\mathrm{k}\left(A_{i}\right)>1$ for each $i \in[1, d-1]$, and we choose each $A_{i}$ with $\mathrm{v}_{h}\left(A_{i}\right)$ minimal. We prove the following assertion:
A. For each $i \in[1, d-1]$, we have $\mathrm{v}_{h}\left(A_{i}\right)<\mathrm{v}_{h}(U) \leq \operatorname{ord}(h) / 2$.

Proof of A. Assume to the contrary that there is an $i \in[1, d-1]$ such that $\mathrm{v}_{h}\left(A_{i}\right) \geq \mathrm{v}_{h}(U)$. Then

$$
h \notin F=\left\{h^{\prime} \in \operatorname{supp}(U) \mid \mathrm{v}_{h^{\prime}}\left(A_{i}\right)<\mathrm{v}_{h^{\prime}}(U)\right\} \quad \text { and } \quad U \mid A_{i} \prod_{h^{\prime} \in F} h^{\operatorname{ord}\left(h^{\prime}\right)} .
$$

Hence $A_{i} \prod_{h^{\prime} \in F} h^{\prime \text { ord }\left(h^{\prime}\right)}=U B_{i}$ for some zero-sum sequence $B_{i}$. By Lemma 4.4 (items (1) and (2)), $B_{i}$ is an atom with $i=\mathrm{v}_{g}\left(A_{i}\right)=\mathrm{v}_{g}\left(B_{i}\right)$ and with $\mathrm{k}\left(B_{i}\right)=\mathrm{k}\left(A_{i}\right)>1$. Since $\mathrm{v}_{h}\left(A_{i}\right)>\mathrm{v}_{h}\left(B_{i}\right)$, this contradicts the choice of $A_{i}$. Proof of $\mathbf{A}$

Let $j \in[1, d-1]$ be such that $\mathrm{k}\left(A_{j}\right)=\min \left\{\mathrm{k}\left(A_{1}\right), \ldots, \mathrm{k}\left(A_{d-1}\right)\right\}$.
Suppose that $j \geq 2$. Let $V_{1}, \ldots, V_{t}$ be all the atoms with $V_{s} \mid A_{1} A_{j-1}$ and $\left|\operatorname{supp}\left(V_{s}\right)\right|=1$ for all $s \in[1, t]$. Then $B=A_{1} A_{j-1}\left(V_{1} \cdot \ldots \cdot V_{t}\right)^{-1}$ is an atom by Lemma 4.4(1). Since $\mathrm{v}_{g}\left(A_{1} A_{j-1}\right)=j<\operatorname{ord}(g), \mathrm{v}_{h}\left(A_{1} A_{j-1}\right)<\operatorname{ord}(h)$, and $\mathrm{v}_{f}\left(A_{1} A_{j-1}\right)<2 \operatorname{ord}(f)$ for all $f \in G_{0} \backslash\{g, h\}$, it follows that $t \leq\left|G_{0}\right|-2=$ $r-1$. Since $\min \Delta\left(G_{0}\right)=r-1$ and $A_{1} A_{j-1}=V_{1} \cdot \ldots \cdot V_{t} B$, we must have $t=1$. Therefore $\mathrm{k}\left(A_{1}\right)+\mathrm{k}\left(A_{j-1}\right)=1+\mathrm{k}(B)$, whence $\mathrm{k}(B)>\mathrm{k}\left(A_{j-1}\right)$. Since

$$
\mathrm{v}_{g}(B)=\mathrm{v}_{g}\left(V_{1} B\right)=\mathrm{v}_{g}\left(A_{1} A_{j-1}\right)=j=\mathrm{v}_{g}\left(A_{j}\right)
$$

Lemma 4.4 (2) implies that $\mathrm{k}(B)=\mathrm{k}\left(A_{j}\right)=\min \left\{\mathrm{k}\left(A_{1}\right), \ldots, \mathrm{k}\left(A_{d-1}\right)\right\}$, a contradiction.

Suppose that $j=1$. Let $V_{1}, \ldots, V_{t}$ be all the atoms with $V_{s} \mid A_{2} A_{d-1}$ and $\left|\operatorname{supp}\left(V_{s}\right)\right|=1$ for all $s \in[1, t]$. Then $B=A_{2} A_{d-1}\left(V_{1} \cdot \ldots \cdot V_{t}\right)^{-1}$ is an atom by Lemma $4.4(1)$. Since $\mathrm{v}_{g}\left(A_{2} A_{d-1}\right)=d+1<\operatorname{ord}(g), \mathrm{v}_{h}\left(A_{2} A_{d-1}\right)<\operatorname{ord}(h)$, and $\mathrm{v}_{f}\left(A_{1} \overline{A_{j-1}}\right)<2 \operatorname{ord}(f)$ for all $f \in G_{0} \backslash\{g, h\}$, it follows that $t \leq\left|G_{0}\right|-2$ $\leq r-1$. Since $\min \Delta\left(G_{0}\right)=r-1$ and $A_{2} A_{d-1}=V_{1} \cdot \ldots \cdot V_{t} B$, we must have $t=1$. Therefore $\mathrm{k}\left(A_{2}\right)+\mathrm{k}\left(A_{d-1}\right)=1+\mathrm{k}(B)$, whence $\mathrm{k}(B)>\mathrm{k}\left(A_{2}\right)$. Since

$$
\mathrm{v}_{g}(B)=\mathrm{v}_{g}\left(V_{1} B\right)=\mathrm{v}_{g}\left(A_{2} A_{d-1}\right)=d+1 \equiv 1=\mathrm{v}_{g}\left(A_{1}\right) \bmod d
$$

Lemma $4.4(2)$ implies that $\mathrm{k}(B)=\mathrm{k}\left(A_{1}\right)=\min \left\{\mathrm{k}\left(A_{1}\right), \ldots, \mathrm{k}\left(A_{d-1}\right)\right\}$, a contradiction.

In the following remark we provide the first example of a minimal non-half-factorial subset $G_{0}$ with $\min \Delta\left(G_{0}\right)=\max \Delta^{*}(G)$ which is not simple. Furthermore, we provide an example showing that the structural statement
given in Theorem 4.5(4) does not hold without the assumption that the exponent is odd.

REmARKS 4.6. Following Schmid, we say that a nonempty subset $G_{0} \subset$ $G \backslash\{0\}$ is simple if there exists $g \in G_{0}$ such that $G_{0} \backslash\{g\}$ is independent and $g \in\left\langle G_{0} \backslash\{g\}\right\rangle$, but $g \notin\langle E\rangle$ for any subset $E \subsetneq G_{0} \backslash\{g\}$.

If $G_{0}$ is a simple subset, then $\left|G_{0}\right| \leq r^{*}(G)+1$ and $G_{0}$ is indecomposable. Moreover, if $G_{1} \subset G$ is such that any proper subset of $G_{1}$ is independent, then there is a subset $G_{0}$ and a transfer homomorphism $\theta: \mathcal{B}\left(G_{1}\right) \rightarrow \mathcal{B}\left(G_{0}\right)$ where $G_{0} \backslash\{0\}$ is simple or independent (for all this see [26, Section 4]). Furthermore, [26, Theorem 4.7] provides an intrinsic description of the sets of atoms of a simple set.

In elementary $p$-groups, every minimal non-half-factorial subset is simple [26, Lemma 4.4], and so far there are no examples of minimal non-halffactorial sets $G_{0}$ with $\min \Delta\left(G_{0}\right)=\max \Delta^{*}(G)$ which are not simple.

1. Let $G=C_{9}^{r-1} \oplus C_{27}$ with $r \geq 26$, and let $\left(e_{1}, \ldots, e_{r}\right)$ be a basis of $G$ with $\operatorname{ord}\left(e_{i}\right)=9$ for $i \in[1, r-1]$ and $\operatorname{ord}\left(e_{r}\right)=27$. Then $\max \Delta^{*}(G)=r-1$ by Theorem 1.1. We set

$$
G_{0}=\left\{3 e_{1}, \ldots, 3 e_{r-1}, e_{r}, g\right\} \quad \text { with } \quad g=e_{1}+\cdots+e_{r} .
$$

Then $\left(e_{r}, g\right)$ is not independent, $G_{0} \backslash\{g\}$ and $G_{0} \backslash\left\{e_{r}\right\}$ are independent, but $g \notin\left\langle G_{0} \backslash\{g\}\right\rangle$ and $e_{r} \notin\left\langle G_{0} \backslash\left\{e_{r}\right\}\right\rangle$. Therefore $G_{0}$ is not simple. It remains to show that $\min \Delta\left(G_{0}\right) \geq r-1$ : then $G_{0}$ is minimal non-halffactorial (because every proper subset is half-factorial) and $\min \Delta\left(G_{0}\right)=$ $r-1$ (because $\max \Delta^{*}(G)=r-1$ ).

We have

$$
\begin{aligned}
W_{1}= & \left\{A \in \mathcal{A}\left(G_{0}\right) \mid \mathrm{k}(A)=1\right\}=\left\{\left(3 e_{1}\right)^{3}, \ldots,\left(3 e_{r-1}\right)^{3}, e_{r}^{27}, g^{27}, g^{9} e_{r}^{18}, g^{18} e_{r}^{9}\right\}, \\
W_{2}= & \left\{A \in \mathcal{A}\left(G_{0}\right) \mid \mathrm{k}(A)>1\right\} \\
= & \left\{A_{3}=g^{3} e_{r}^{24}\left(3 e_{1}\right)^{2} \cdot \ldots \cdot\left(3 e_{r-1}\right)^{2}, A_{6}=g^{6} e_{r}^{21}\left(3 e_{1}\right) \cdot \ldots \cdot\left(3 e_{r-1}\right),\right. \\
& A_{12}=g^{12} e_{r}^{15}\left(3 e_{1}\right)^{2} \cdot \ldots \cdot\left(3 e_{r-1}\right)^{2}, A_{15}=g^{15} e_{r}^{12}\left(3 e_{1}\right) \cdot \ldots \cdot\left(3 e_{r-1}\right), \\
& \left.A_{21}=g^{21} e_{r}^{6}\left(3 e_{1}\right)^{2} \cdot \ldots \cdot\left(3 e_{r-1}\right)^{2}, A_{24}=g^{24} e_{r}^{3}\left(3 e_{1}\right) \cdot \ldots \cdot\left(3 e_{r-1}\right)\right\},
\end{aligned}
$$

and $\mathrm{k}\left(A_{3}\right)=\mathrm{k}\left(A_{12}\right)=\mathrm{k}\left(A_{21}\right)=(2 r+1) / 3, \mathrm{k}\left(A_{6}\right)=\mathrm{k}\left(A_{15}\right)=\mathrm{k}\left(A_{24}\right)=$ $(r+2) / 3$. For any $d \in \Delta\left(G_{0}\right)$, there exists $B \in \mathcal{B}\left(G_{0}\right)$ that has two such factorizations, say
$B=U_{1} \cdot \ldots \cdot U_{s} V_{1} \cdot \ldots \cdot V_{t} W_{1} \cdot \ldots \cdot W_{u}=X_{1} \cdot \ldots \cdot X_{s^{\prime}} Y_{1} \cdot \ldots \cdot Y_{t^{\prime}} Z_{1} \cdot \ldots \cdot Z_{u^{\prime}}$
where all $U_{i}, V_{j}, W_{k}, X_{i^{\prime}}, Y_{j^{\prime}}, Z_{k^{\prime}}$ are atoms, $s, t, u, s^{\prime}, t^{\prime}, u^{\prime} \in \mathbb{N}_{0}$ with $d=$ $(s+t+u)-\left(s^{\prime}+t^{\prime}+u^{\prime}\right), \mathrm{k}\left(U_{1}\right)=\cdots=\mathrm{k}\left(U_{s}\right)=\mathrm{k}\left(X_{1}\right)=\cdots=\mathrm{k}\left(X_{s^{\prime}}\right)=$ $(2 r+1) / 3, \mathrm{k}\left(V_{1}\right)=\cdots=\mathrm{k}\left(V_{t}\right)=\mathrm{k}\left(Y_{1}\right)=\cdots=\mathrm{k}\left(Y_{t^{\prime}}\right)=(r+2) / 2$, and
$\mathrm{k}\left(W_{1}\right)=\cdots=\mathrm{k}\left(W_{u}\right)=\mathrm{k}\left(Z_{1}\right)=\cdots=\mathrm{k}\left(Z_{u^{\prime}}\right)=1$. This implies that

$$
\mathrm{k}(B)=s \frac{2 r+1}{3}+t \frac{r+2}{3}+u=s^{\prime} \frac{2 r+1}{3}+t^{\prime} \frac{r+2}{3}+u^{\prime}
$$

and $\mathrm{v}_{3 e_{1}}(B) \equiv 2 s+t \equiv 2 s^{\prime}+t^{\prime} \bmod 3$. Since $d=(s+t+u)-\left(s^{\prime}+t^{\prime}+u^{\prime}\right)=$ $\frac{r-1}{3}\left(\left(t^{\prime}-t\right)+2\left(s^{\prime}-s\right)\right)>0$, we conclude that $\left(t^{\prime}-t\right)+2\left(s^{\prime}-s\right) \geq 3$ and hence $d \geq r-1$.
2. We provide an example of a minimal non-half-factorial LCN-set $G_{0}$ with $\min \Delta\left(G_{0}\right)=\max \Delta^{*}(G)$ in a group $G$ of even exponent which has no element $g \in G_{0}$ such that $G_{0} \backslash\{g\}$ is independent. In particular, $G_{0}$ is not simple and the assumption in Theorem 4.5(4) that the exponent of the group is odd cannot be cancelled.

Let $G=C_{2}^{r-2} \oplus C_{4} \oplus C_{4}$ with $r \geq 3$, and let $\left(e_{1}, \ldots, e_{r}\right)$ be a basis of $G$ with $\operatorname{ord}\left(e_{i}\right)=2$ for $i \in[1, r-2]$ and $\operatorname{ord}\left(e_{r-1}\right)=\operatorname{ord}\left(e_{r}\right)=4$. We set

$$
G_{0}=\left\{e_{1}, \ldots, e_{r-3}, e_{r-2}+e_{r-1}, e_{r-1}, e_{r}, g\right\}, \quad g=e_{1}+\cdots+e_{r-2}+e_{r}
$$

Since $\left(e_{r-2}+e_{r-1}, e_{r-1}\right)$ is dependent and $\left(e_{r}, g\right)$ is dependent, there is no $h \in G_{0}$ such that $G_{0} \backslash\{h\}$ is independent. We have

$$
\begin{aligned}
W_{1}= & \left\{A \in \mathcal{A}\left(G_{0}\right) \mid \mathrm{k}(A)=1\right\} \\
= & \left\{e_{1}^{2}, \ldots, e_{r-3}^{2},\left(e_{r-2}+e_{r-1}\right)^{4}, e_{r-1}^{4},\right. \\
W_{2}= & \left\{A \in \mathcal{A}\left(G_{0}\right) \mid \mathrm{k}(A)>1\right\} \\
= & \left\{A_{1}=g e_{r}^{3}\left(e_{r-2}+g^{4},\left(e_{r-2}+e_{r-1}\right)^{2} e_{r-1}^{2}, e^{2} e_{r-1}^{2} e_{1} \cdot \ldots \cdot e_{r-3},\right.\right. \\
& B_{1}=g e_{r}^{3}\left(e_{r-2}+e_{r-1}\right)^{3} e_{r-1} e_{1} \cdot \ldots \cdot e_{r-3}, \\
& A_{3}=g^{3} e_{r}\left(e_{r-2}+e_{r-1}\right) e_{r-1}^{3} e_{1} \cdot \ldots \cdot e_{r-3} \\
& \left.B_{3}=g^{3} e_{r}\left(e_{r-2}+e_{r-1}\right)^{3} e_{r-1} e_{1} \cdot \ldots \cdot e_{r-3}\right\},
\end{aligned}
$$

and $\mathrm{k}\left(A_{1}\right)=\mathrm{k}\left(A_{3}\right)=\mathrm{k}\left(B_{1}\right)=\mathrm{k}\left(B_{3}\right)=(r+1) / 2$. Theorem 1.1 implies that $\max \Delta^{*}(G)=r-1$, and thus it remains to show that $\min \Delta\left(G_{0}\right)=r-1$.

For any $d \in \Delta\left(G_{0}\right)$, there exists $B \in \mathcal{B}\left(G_{0}\right)$ with two such factorizations, say

$$
B=U_{1} \cdot \ldots \cdot U_{s} V_{1} \cdot \ldots \cdot V_{t}=X_{1} \cdot \ldots \cdot X_{u} Y_{1} \cdot \ldots \cdot Y_{v}
$$

where all $U_{i}, V_{j}, X_{k}, Y_{l}$ are atoms, $s, t, u, v \in \mathbb{N}_{0}$ with $d=u+v-(s+t)$, $\mathrm{k}\left(U_{1}\right)=\cdots=\mathrm{k}\left(U_{s}\right)=\mathrm{k}\left(X_{1}\right)=\cdots=\mathrm{k}\left(X_{u}\right)=1$, and $\mathrm{k}\left(V_{1}\right)=\cdots=\mathrm{k}\left(V_{t}\right)=$ $\mathrm{k}\left(Y_{1}\right)=\cdots=\mathrm{k}\left(Y_{v}\right)=(r+1) / 2$. This implies that

$$
\mathrm{k}(B)=s+t \frac{r+1}{2}=u+v \frac{r+1}{2}
$$

and $\mathrm{v}_{g}(B) \equiv t \equiv v \bmod 2$. Since $d=(v+u)-(s+t)=(t-v) \frac{r-1}{2}>0$, we infer that $t-v \geq 2$ and hence $d \geq r-1$.

Acknowledgements. The referee read the manuscript twice with utmost care. We would like to thank him/her for all the work which helped to improve the clarity of the arguments and the presentation of the paper. This work was supported by the Austrian Science Fund FWF, Project Number M1641-N26.
