ON REGULAR SOLUTIONS TO TWO-DIMENSIONAL THERMOVISCOELASTICITY

Abstract. A two-dimensional thermoviscoelastic system of Kelvin–Voigt type with strong dependence on temperature is considered. The existence and uniqueness of a global regular solution is proved without small data assumptions. The global existence is proved in two steps. First, a global a priori estimate is derived by applying anisotropic Sobolev spaces with a mixed norm. Then local existence, proved by the method of successive approximations for a sufficiently small time interval, is extended step by step in time. By a two-dimensional solution we mean that all the relevant quantities depend on two space variables only.

1. Introduction. This article is devoted to the problem of global existence and uniqueness of regular solutions to a two-dimensional (2d) thermoviscoelasticity system for small strains which is still strongly nonlinear. The system describes homogeneous isotropic linearly-responding viscoelastic materials in the Kelvin–Voigt rheology at small strains. We assume that the specific heat and the elasticity tensor depend on the temperature in a very special way.

The paper is a companion paper to [GZ4]. Compared to [GZ4], the proof of the global a priori estimate is only sketched (see Section 5) but the proof of local existence is added.

Recently in [PZ1] global existence of regular solutions to three-dimensional thermoviscoelasticity with specific heat linearly increasing with temperature and with constant heat conductivity has been proved. This setting

is a particular case of systems considered in [BG, R1]. Existence of weak solutions for generalized thermoviscoelastic materials with various kinds of boundary conditions has been proved in [R2, RR]. Moreover, the papers of Roubíček [R1, R2, R3] and Rossi–Roubíček [RR] present a deep physical background on thermoviscoelastic materials.

Pioneering papers on global regular solutions to one-dimensional thermoviscoelasticity are [SL, D, DH], and the spherical case is considered in [GA]. Recently, global existence of large solutions to spherically symmetric nonlinear viscoelasticity has been proved in [GZ1, GZ2].

In this paper we consider a two-dimensional thermoviscoelastic system with the temperature dependent specific heat of the form

\[ c^* = c_v \theta^\sigma \]

with \( 1/2 < \sigma < 1 \), \( c_v \) a positive constant, and with constant heat conductivity. This setting is a particular case of systems addressed in [R1]. Moreover, the stress tensor is given by a linear thermoviscoelastic law of Kelvin–Voigt type (cf. [EJK, Chapter 5.4]). The aim of this paper is to prove existence of global regular solutions to the 2d-thermoviscoelastic system without smallness assumptions on data and for \( \sigma \) as small as possible. In the 3d-case (see [PZ1]) existence of global regular solutions for large data is only proved for \( \sigma = 1 \).

Restricting our considerations to the 2d case we are able to use the specific heat \( c^* = c_v \theta^\sigma \), \( \sigma \in (1/2, 1) \).

The proof of global existence is in two main steps. First we need a global a priori estimate in Sobolev spaces \( W^{2,1}_{p,p_0}(\Omega^T) \) with mixed norm. This is possible because equations for displacement and temperature are parabolic. This idea was developed in [PZ1]. Since \( c^* = c_v \theta^\sigma \) is the coefficient heat near \( \theta, t \) we need continuity of \( \theta \) to apply the theory for parabolic equations, so \( p \) and \( p_0 \) must be sufficiently large. Next, we prove local existence in \( W^{2,1}_{p,p_0}(\Omega^T) \)-spaces by the method of successive approximations. Combining these two steps we prove the main result: global existence of regular solutions with large data.

Thus we consider the following thermoviscoelasticity system:

\[
\begin{align*}
(1.1) \quad & u_{tt} - \text{div}(A_1 \varepsilon_{,t} + A_2 \varepsilon) + A \theta = b \quad \text{in } \Omega^T = \Omega \times (0, T), \\
(1.2) \quad & c_v \theta^\sigma \theta_{,t} - \kappa \Delta \theta = \theta A \varepsilon_{,t} + (A_1 \varepsilon_{,t}) \cdot \varepsilon_{,t} + g \quad \text{in } \Omega^T,
\end{align*}
\]

where \( \Omega \subset \mathbb{R}^2 \), with boundary \( S \), is bounded, and \( \sigma \) is a positive constant. We add the boundary conditions

\[
(1.3) \quad u = 0, \quad \bar{n} \cdot \nabla \theta = 0 \quad \text{on } S^T = S \times (0, T),
\]

where \( \bar{n} \) is the unit outward normal vector to \( S \), and the initial conditions

\[
(1.4) \quad u|_{t=0} = u_0, \quad u_{,t}|_{t=0} = u_1, \quad \theta|_{t=0} = \theta_0 \quad \text{in } \Omega.
\]

The field \( u : \Omega^T \rightarrow \mathbb{R}^2 \) is the displacement, and \( \theta : \Omega^T \rightarrow \mathbb{R}_+ \) is the absolute temperature. The second order tensors \( \varepsilon = \{\varepsilon_{ij}\}_{i,j=1,2} \) and \( \varepsilon_{,t} = \{\varepsilon_{ij,t}\}_{i,j=1,2} \)
Two-dimensional thermoviscoelasticity

209

denote, respectively, the fields of the linearized strain and the strain rate, which are defined by
\[ \varepsilon = \varepsilon(u) = \frac{1}{2}(\nabla u + (\nabla u)^T), \quad \varepsilon_{,t} = \varepsilon(u_{,t}) = \frac{1}{2}(\nabla u_{,t} + (\nabla u_{,t})^T). \]

Equation (1.1) is the linear momentum balance with the stress tensor given by a linear thermoviscoelastic law of Kelvin–Voigt type (cf. [EJK, Chapter 5.4])
\[ \mathbb{S} = A_1\varepsilon_{,t} + A_2\varepsilon + A\theta. \]

The fourth order tensors \( A_1 = \{A_{ijkl}\}_{i,j,k,l=1,2} \) and \( A_2 = \{A_{ijkl}\}_{i,j,k,l=1,2} \) are respectively, the linear viscoelasticity and the elasticity tensors, defined by the Hook law
\[ \varepsilon \mapsto A_i\varepsilon = \lambda_i \text{tr} \varepsilon \mathbb{I} + 2\mu_i \varepsilon, \quad i = 1, 2, \]
where \( \lambda_1, \mu_1 \) are the viscosity constants and \( \lambda_2, \mu_2 \) are the Lamé constants, both \( \lambda_1, \mu_1 \) and \( \lambda_2, \mu_2 \) with values within the elasticity range
\[ \mu_i > 0, \quad 3\lambda_i + 2\mu_i > 0, \quad i = 1, 2, \]
and \( \mathbb{I} \) is the unit matrix. In the case of (1.1), (1.2) the free energy is specified by
\[ f(\varepsilon, \theta) = f^*(\theta) + W(\varepsilon, \theta), \]
where
\[ f^*(\theta) = -\frac{c_v}{\sigma(\sigma + 1)}\theta^{\sigma+1}, \quad c_v = \text{const} > 0, \]
is the caloric energy, and
\[ W(\varepsilon, \theta) = \frac{1}{2}(\varepsilon - \theta\alpha) \cdot A_2(\varepsilon - \theta\alpha) - \frac{1}{2}\theta^2\alpha \cdot (A_2\alpha) \]
\[ = \frac{1}{2}\varepsilon \cdot (A_2\varepsilon) - \theta\varepsilon \cdot (A_2\alpha) \]
is the elastic energy, where \( \alpha = (\alpha_{ij})_{i,j=1,2} \), with constant \( \alpha_{ij} \), is the symmetric thermal expansion tensor. For notational simplicity we introduce the second order symmetric tensor \( A \) given by
\[ -A_2\alpha = A. \]

From (1.10) the specific heat takes the form
\[ c_* = -\theta f''^*(\theta) = c_v\theta^\sigma. \]
The dissipation potential corresponding to system (1.1), (1.2) is given by
\[ D = \frac{1}{2\theta}\varepsilon_{,t} \cdot (A_1\varepsilon_{,t}) + \frac{k}{2}\theta^2\left|\nabla \frac{1}{\theta}\right|^2, \]
where \( k > 0 \) is the constant heat conductivity. Hence, by the Fourier law the heat flux takes the form
\[ q = k\theta^2\nabla \frac{1}{\theta} = -k\nabla \theta. \]
Let us consider the problem

\[ u = \{u_i\}, \; v = \{v_i\}, \; S = \{S_{ij}\}, \; R = \{R_{ij}\}, \; A_m = \{A_{mijkl}\}, \; m = 1, 2, \; \varepsilon = \{\varepsilon_{ij}\}, \; A = \{A_{ij}\}. \]

Then we apply the summation convention: \( u \cdot v = u_i v_i, \; S \cdot R = S_{ij} R_{ij}, \; (Su)_i = S_{ij} u_j, \; (A_m\varepsilon)_{ij} = A_{mijkl} \varepsilon_{kl}, \; (A_m \varepsilon) \cdot \varepsilon = A_{mijkl} \varepsilon_{kl} \varepsilon_{ij}. \) Moreover, we have

\[ \nabla \cdot (A_m \varepsilon)_i = \partial x_j (A_{mijkl} \varepsilon_{kl}). \]

We define linear viscosity and elasticity tensors \( Q_1 \) and \( Q_2 \) by

\[ u \mapsto Q_i u = \nabla \cdot (A_i \varepsilon(u)) = \mu_i \Delta u + (\lambda_i + \mu_i) \nabla \nabla \cdot u, \quad i = 1, 2. \]

In view of (1.16) equation (1.1) takes the form

\[ u_{tt} - Q_1 u_{tt} - Q_2 u = \nabla \cdot (A\theta) + b. \]

We assume that the tensors \( A_m \) satisfy the symmetry conditions

\[ (A_m)_{ijkl} = (A_m)_{jikl} = (A_m)_{klij}, \quad m = 1, 2, \]

and coercivity and boundedness

\[ a_{m*} |\varepsilon|^2 \leq (A_m \varepsilon) \cdot \varepsilon \leq a_m^* |\varepsilon|^2, \quad m = 1, 2, \]

where

\[ a_{m*} = \min \{3\lambda m + 2\mu m, 2\mu m\}, \quad a_m^* = \max \{3\lambda m + 2\mu m, 2\mu m\}. \]

Let us consider the problem

\[ \begin{align*}
Q_m u &= f_m \quad \text{in } \Omega \subset \mathbb{R}^2, \; m = 1, 2, \\
u &= 0 \quad \text{on } S.
\end{align*} \tag{1.20} \]

**Lemma 1.1** ([LM, Ch. 2]). Let \( f_m \in L_2(\Omega) \) and suppose conditions (1.18), (1.19) hold. Then there exists a unique solution to (1.20) such that \( u \in H^2(\Omega) \) and

\[ \|u\|_{H^2(\Omega)} \leq c_m \|f_m\|_{L_2(\Omega)}, \quad m = 1, 2. \tag{1.21} \]

For \( u \in \text{Dom } Q_m \cap H^1_0(\Omega) \) inequality (1.21) can be written in the form

\[ \|u\|_{H^2(\Omega)} \leq c_m \|Q_m u\|_{L_2(\Omega)}, \quad m = 1, 2. \tag{1.22} \]

The operators \( Q_m, \; m = 1, 2, \) are self-adjoint on \( \text{Dom } Q_m \cap H^1_0(\Omega), \)

\[ (Q_m u, v)_{L_2(\Omega)} = -\mu_m (\nabla u, \nabla v)_{L_2(\Omega)} - (\lambda_m + \mu_m) (\nabla \cdot u, \nabla \cdot v)_{L_2(\Omega)} = (u, Q_m)_{L_2(\Omega)} \quad \text{for } u, v \in \text{Dom } Q_m \cap H^1_0(\Omega). \tag{1.23} \]

Moreover, the operators \( -Q_m \) are positive on \( \text{Dom } Q_m \cap H^1_0(\Omega), \)

\[ -(Q_m u, u) = \mu_m \|\nabla u\|_{L_2(\Omega)}^2 + (\lambda_m + \mu_m) \|\nabla \cdot u\|_{L_2(\Omega)}^2 \geq 0. \tag{1.24} \]

Hence there exists the fractional power \( Q_m^{1/2} \) satisfying

\[ (Q_m^{1/2} u, Q_m^{1/2} v) = (Q_m^{1/2} u, Q_m^{1/2} v)_{L_2(\Omega)} = (u, -Q_m v)_{L_2(\Omega)} \]

for \( u, v \in \text{Dom } Q_m \cap H^1_0(\Omega). \)
From (1.19) and the Korn inequality (1.26)
\[ d_0^{1/2} \|u\|_{H^1(\Omega)} \leq \|\varepsilon(u)\|_{L^2(\Omega)} \quad \text{for } u \in H^1_0(\Omega), \ d_0 > 0, \]
it follows that
\[ \|Q^{1/2}_m u\|_{L^2(\Omega)}^2 = \mu_m \|\nabla u\|_{L^2(\Omega)}^2 + (\lambda_m + \mu_m) \|\nabla \cdot u\|_{L^2(\Omega)}^2 \]
\[ = (A_m \varepsilon(u), \varepsilon(u))_{L^2(\Omega)} \geq a_m \|\varepsilon(u)\|_{L^2(\Omega)}^2 \geq a_m d_0 \|u\|_{H^1(\Omega)}. \]

**Main Theorem.** Suppose that (1.7), (1.8), \(g > 0\) and the assumptions of Lemma 4.1 with \(A = \text{const}\) hold. Let \(T \in (0, \infty), \ b \in L^{p_0}_{p_0}(\Omega^T), \ g \in L_{q_0}(\Omega^T) \cap L_1(0, T; L_\infty(\Omega)), \ u_0 \in W^{2}_{p}(\Omega), \ u_1 \in B^{2-2/p_0}_{p_0}(\Omega), \ \theta_0 \in B^{2-2/q_0}_{q_0}(\Omega), \ p, p_0, q, q_0 \geq 4, \ 1/2 < \sigma \leq 1. \) Assume \(S \in C^2. \) Then there exists a global solution to problem (1.1)–(1.4) such that
\[ u, t \in W^{2,1}_{p,p_0}(\Omega^T), \ \theta \in W^{2,1}_{q,q_0}(\Omega^T), \ \theta \geq \theta_* > 0. \]

The paper is organized in the following way. In Section 2 we show that the property \(g \geq 0\) (see [PZ1]) implies that the second law of thermodynamics holds. In Section 3 we define the spaces used, together with the corresponding imbeddings and interpolations, and we present solvability results for some parabolic initial-boundary value problems (3.1) and (3.4). Section 4 is devoted to showing a positive infimum of the temperature. In Section 5 we state some global a priori estimates. The main estimate is the Hölder continuity of temperature, which implies that \(W^{2,1}_{p,p_0}\)-theory can be applied to (1.2). This is compatible with the results of Section 6. Applying the method of successive approximations, in Section 6 we prove local existence of solutions to problem (1.1)–(1.4). Finally, in Section 7 we show global existence of solutions to (1.1)–(1.4) by applying comparison results from Sections 5 and 6.

**2. Physical and thermodynamical background.** In view of the basic thermodynamic relations, the specific internal energy \(e\) and the entropy \(\eta\) are related to the free energy \(f\) by the formula
\[ e = f + \theta \eta, \ \ \eta = -f_{,\theta}. \]
For the free energy \(f\) defined by (1.9)–(1.11) this gives
\[ e = \frac{c_v}{\sigma + 1} \theta^{\sigma + 1} + \frac{1}{2} \varepsilon \cdot (A_2 \varepsilon), \ \ \eta = \frac{c_v}{\sigma} \theta^\sigma + (A_2 \alpha) \cdot \varepsilon. \]
As a consequence of the second law of thermodynamics expressed by the Clausius–Duhem inequality, the stress tensor \(S\) and the heat flux \(q\) satisfy
\[ S = \frac{\partial f}{\partial \varepsilon} + \theta \frac{\partial D}{\partial \varepsilon_t}, \ \ q = \frac{\partial D}{\partial \nabla 1/\theta}, \]
and the explicit forms of \(S\) and \(q\) are described by (1.6) and (1.15).
Repeating the considerations from [PZ1, Section 2] we can derive the Clausius–Duhamel inequality
\[ \eta_t + \nabla \cdot \frac{q}{\theta} \geq \frac{g}{\theta}. \]

3. Notation and auxiliary results

3.1. Notation. Let \( \Omega \subset \mathbb{R}^n, n \geq 1 \), be a domain with boundary \( S \). Let \( \Omega^T = \Omega \times (0, T), S^T = S \times (0, T) \) with \( T \) finite. By \( W_p^k(\Omega) \), \( k \in \mathbb{N} \cup \{0\} = \mathbb{N}_0 \), \( p \in [1, \infty) \), we denote the Sobolev space with the norm
\[ \|u\|_{W_p^k(\Omega)} = \left( \sum_{|\alpha| \leq k} \int \! |D_\alpha u|^p \, dx \right)^{1/p}, \]
where \( \alpha = (\alpha_1, \ldots, \alpha_n) \) is a multi-index, \( \alpha_i \in \mathbb{N}_0 \), \( |\alpha| = \alpha_1 + \cdots + \alpha_n \), \( D^\alpha = \partial_{x_1}^{\alpha_1} \cdots \partial_{x_n}^{\alpha_n} \). Let \( H^k(\Omega) = W_2^k(\Omega) \).

Next, we introduce anisotropic Lebesgue spaces \( L_{p,p_0}(\Omega^T) = L_{p_0}(0, T; L_p(\Omega)) \), \( p, p_0 \in [1, \infty] \), with the norm
\[ \|u\|_{L_{p,p_0}(\Omega^T)} = \left( \int_0^T \|u(t)\|_{L_{p_0}(\Omega)}^{p_0} \, dt \right)^{1/p_0}. \]
Moreover, \( W_{p,p_0}^{k,k/2}(\Omega^T) \), \( k, k/2 \in \mathbb{N}_0 \), \( p, p_0 \in [1, \infty] \), is the Sobolev space with a mixed norm, which is a completion of the set of \( C^\infty(\Omega^T) \)-functions under the norm
\[ \|u\|_{W_{p,p_0}^{k,k/2}(\Omega^T)} = \left( \int_0^T \left( \sum_{|\alpha| + 2\alpha \leq k} \int \! |D^\alpha \partial_\alpha u|^p \, dx \right)^{p_0/p} \, dt \right)^{1/p_0}. \]
We denote by \( W_{p,p_0}^{s,s/2}(\Omega^T) \), \( s \in \mathbb{R}_+, p, p_0 \in [1, \infty] \), the Sobolev–Slobodetskiĭ space with the norm
\[ \|u\|_{W_{p,p_0}^{s,s/2}(\Omega^T)} = \sum_{|\alpha| + 2a \leq [s]} \|D^\alpha \partial_\alpha u\|_{L_{p,p_0}(\Omega^T)} \]
\[ + \int_0^T \left( \int_{\Omega} \sum_{|\alpha| + 2a = [s]} \frac{|D^\alpha \partial_\alpha u(x, t) - D^\alpha \partial_\alpha u(x', t)|^p}{|x - x'|^{n+p(s-[s])}} \, dx \, dx' \right)^{p_0/p} \, dt \]
\[ + \int_0^T \left( \int_{\Omega} \sum_{|\alpha| + 2a = [s]} \frac{|D^\alpha \partial_\alpha u(x, t) - D^\alpha \partial_\alpha u(x, t')|^p}{|t - t'|^{1+p(s/2-[s/2])}} \, dx \right)^{p_0/p} \, dt \, dt', \]
where \( a \in \mathbb{N}_0 \) and \( [s] \) is the integer part of \( s \).

For \( s \) odd the last term in the above norm vanishes whereas for \( s \) even the last two terms vanish. We also use the notation \( L_p(\Omega^T) = L_{p,p}(\Omega^T) \), \( W_p^{s,s/2}(\Omega^T) = W_{p,p}^{s,s/2}(\Omega^T) \), and so on.
Two-dimensional thermoviscoelasticity

\[ B_{p,p_0}^l(\Omega), \quad l \in \mathbb{R}_+, \quad p, p_0 \in [1, \infty), \] is the Besov space of functions making the following norm finite:

\[
\|u\|_{B_{p,p_0}^l(\Omega)} = \|u\|_{L^p(\Omega)} + \left( \sum_{i=1}^{\infty} \int_0^\infty \frac{\|\Delta_i^m(h, \Omega) \partial_{x_i}^k u\|_{L^p(\Omega)}^{p_0}}{h^{1+lp_0}} \, dh \right)^{1/p_0},
\]

where \( k \in \mathbb{N}_0, \ m \in \mathbb{N}, \ m > l - k > 0, \ \Delta_i^l(h, \Omega)u, \ j \in \mathbb{N}, \ h \in \mathbb{R}_+, \) is the finite difference of the order \( j \) of the function \( u(x) \) with respect to \( x_i \) with

\[
\Delta_i^l(h, \Omega)u = \Delta_i(h, \Omega)u
\]

\[
= u(x_1, \ldots, x_{i-1}, x_i + h, x_{i+1}, \ldots, x_n) - u(x_1, \ldots, x_n),
\]

\[
\Delta_i^l(h, \Omega)u = \Delta_i(h, \Omega) \Delta_i^{l-1}(h, \Omega)u \text{ and } \Delta_i^l(h, \Omega)u = 0 \text{ for } x + jh \notin \Omega.
\]

From \([G]\) it is known that the norms of the Besov space \( B_{p,p_0}^l(\Omega) \) are equivalent for different \( m \) and \( k \) satisfying \( m > l - k > 0 \).

We denote by \( V_2^m(\Omega) \) the space \( L^\infty(0, T; L^2(\Omega)) \cap L^2(0, T; H^1(\Omega)) \) of functions making the following norm finite:

\[
\|u\|_{V_2^m(\Omega)} = \text{ess sup}_{t \in [0, T]} \|u(t)\|_{L^2(\Omega)} + \|\nabla u\|_{L^2(\Omega^T)}.
\]

Next, \( V_2^{1,0}(\Omega^T) = V_2^1(\Omega^T) \cap C([0, T]; L^2(\Omega)) \).

Let \( C^{\alpha,\alpha/2}(\Omega^T), \ \alpha \in (0, 1) \), denote the anisotropic Hölder space of functions making the following norm finite:

\[
\|u\|_{C^{\alpha,\alpha/2}(\Omega^T)} = \sup_{\Omega_T} |u(x, t)| + \sup_{x'\neq x''} \frac{|u(x', t) - u(x'', t)|}{|x' - x''|^\alpha}
\]

\[
+ \sup_{x' \neq x''} \frac{|u(x', t') - u(x, t'')|}{|t' - t''|^{\alpha/2}}.
\]

We denote by \( c \) a generic positive constant which changes its value from formula to formula and depends at most on the imbedding constants, constants of the problem, and the regularity of the boundary.

Let \( \varphi = \varphi(\sigma_1, \ldots, \sigma_k), \ k \in \mathbb{N} \), denote a generic positive increasing function of its arguments \( \sigma_1, \ldots, \sigma_k \), which may change from formula to formula.

**3.2. Auxiliary results.** We need the following interpolation lemma:

**Lemma 3.1** (see \([BIN\ Ch. \ 4, \ Sect. 18])\). Let \( \varepsilon \in (0, 1) \), \( u \in W_0^{s, s_0^2}(\Omega^T), \ s \in \mathbb{R}_+, \ p, p_0 \in [1, \infty] \), and \( \Omega \subset \mathbb{R}^2 \). Let \( \sigma \in \mathbb{R}_+ \cup \{0\} \), and suppose

\[
\nu = \frac{2}{p} + \frac{2}{p_0} - \frac{2}{q} - \frac{2}{q_0} + |\alpha| + 2a + \sigma < s.
\]

Then \( D^{\alpha}_x \partial_t^\nu u \in W_0^{\sigma, \sigma_0^2}(\Omega^T), \ q \geq p, \ q_0 \geq p_0 \), and

\[
\|D^{\alpha}_x \partial_t^\nu u\|_{W_0^{\sigma, \sigma_0^2}(\Omega^T)} \leq \varepsilon^{s-\nu} \|u\|_{W_0^{s, s_0^2}(\Omega^T)} + c\varepsilon^{-\nu} \|u\|_{L^p_{p,p_0}(\Omega^T)}.
\]
As a special case of Lemma 3.1 we need

**Lemma 3.2 (see [BIN, Ch. 4, Sect. 18])**. Let \( \varepsilon \in (0, 1) \), \( u \in W^s_\sigma(\Omega) \), \( s \in \mathbb{R}_+ \), \( p \in [1, \infty] \), \( \Omega \subset \mathbb{R}^2 \). Let \( \sigma \in \mathbb{R}_+ \cup \{0\} \) and suppose

\[
\kappa = \frac{2}{p} - \frac{2}{q} + |\alpha| + \sigma < s.
\]

Then \( D^\alpha_x u \in W^\sigma_q(\Omega) \), \( q \geq p \), and

\[
\|D^\alpha_x u\|_{W^\sigma_q(\Omega)} \leq \varepsilon^{s-\kappa}\|u\|_{W^s_\sigma(\Omega)} + c\varepsilon^{-\kappa}\|u\|_{L_p(\Omega)}.
\]

We also need the following interpolation result

**Lemma 3.3 (see [BIN, Ch. 3, Sect. 15])**. Assume that \( u \in W^l_{p_2}(\Omega) \cap L_{p_1}(\Omega) \), \( \Omega \subset \mathbb{R}^2 \) and

\[
\frac{2}{p} - r = (1 - \theta)\frac{2}{p_1} + \theta\left(\frac{2}{p_2} - l\right).
\]

Then

\[
\sum_{|\alpha| = r} \|D^\alpha_x u\|_{L_p(\Omega)} \leq c\|u\|_{W^l_{p_2}(\Omega)}^{\theta}\|u\|_{L_{p_1}(\Omega)}^{1-\theta}
\]

We recall from [B] the trace and the inverse trace theorems for Sobolev–Slobodetskiǐ spaces with mixed norm.

**Lemma 3.4.**

(i) Let \( u \in W^{s,s/2}_{p,p_0}(\Omega^T) \), \( s \in \mathbb{R}_+ \), \( s > 2/p_0 \), \( p, p_0 \in (1, \infty) \). Then \( u(x, t_0) = u(x, t)|_{t = t_0} \) for \( t_0 \in [0, T] \) belongs to \( B^{s-2/p_0}_{p,p_0}(\Omega) \) and

\[
\|u(\cdot, t_0)\|_{B^{s-2/p_0}_{p,p_0}(\Omega)} \leq c\|u\|_{W^{s,s/2}_{p,p_0}(\Omega^T)}.
\]

(ii) For a given \( \tilde{u} \in B^{s-2/p_0}_{p,p_0}(\Omega) \), \( s \in \mathbb{R}_+ \), \( s > 2/p_0 \), \( p, p_0 \in (1, \infty) \), there exists a function \( u \in W^{s,s/2}_{p,p_0}(\Omega^T) \) such that \( u|_{t = t_0} = \tilde{u} \) for \( t_0 \in [0, T] \) and

\[
\|u\|_{W^{s,s/2}_{p,p_0}(\Omega^T)} \leq c\|\tilde{u}\|_{B^{s-2/p_0}_{p,p_0}(\Omega)}.
\]

**Lemma 3.5 (see [BIN, Ch. 3, Sect. 10.4 and Ch. 4, Sect. 18])**. Let \( \varepsilon \in (0, 1) \), \( u \in W^{s,s/2}_{p,p_0}(\Omega^T) \), \( s \in \mathbb{R}_+ \), \( p, p_0 \in (1, \infty) \), and \( \Omega \subset \mathbb{R}^2 \). Let \( \sigma \in \mathbb{R}_+ \) and assume

\[
\kappa = \frac{2}{p} + \frac{2}{p_0} + |\alpha| + \sigma < s.
\]

Then \( u \in C^{\sigma,\sigma/2}(\Omega^t) \) and

\[
\|u\|_{C^{\sigma,\sigma/2}(\Omega^t)} \leq \varepsilon^{s-\kappa}\|u\|_{W^{s,s/2}_{p,p_0}(\Omega^T)} + c\varepsilon^{-\kappa}\|u\|_{L_{p,p_0}(\Omega^t)}.
\]
Let us consider the problem

\begin{align}
  u_t - Qu &= f & \text{in } \Omega^T, \\
  u &= 0 & \text{on } S^T, \\
  u|_{t=0} &= u_0 & \text{in } \Omega,
\end{align}

where \( \Omega \subset \mathbb{R}^2 \) and

\[ Qu = \mu \Delta u + \nu \nabla (\nabla \cdot u) \]

with \( \mu, \nu > 0 \). Notice that \( Q \) replaces \( Q_i \), so \( \mu = \mu_i, \nu = \lambda_i + \mu_i, i = 1, 2 \). Hence assumption \((1.9)\) implies that indeed \( \mu, \nu > 0 \).

**Lemma 3.6 (parabolic system in \( W^{2,1}_{p,p_0}(\Omega^T) \)).**

(i) Assume that \( f \in L_{p,p_0}(\Omega^T), u_0 \in B^{2-2/p_0}_{p,p_0}(\Omega), p, p_0 \in (1, \infty) \) and \( S \in C^2 \). If \( 2 - 2/p_0 - 1/p > 0 \), the compatibility condition \( u_0|_S = 0 \) is assumed. Then there exists a unique solution to problem \((3.1)\) such that \( u \in W^{2,1}_{p,p_0}(\Omega^T) \) and

\[ \|u\|_{W^{2,1}_{p,p_0}(\Omega^T)} \leq c(\|f\|_{L_{p,p_0}(\Omega^T)} + \|u_0\|_{B^{2-2/p_0}_{p,p_0}(\Omega)}) \]

with a constant \( c \) depending on \( \Omega, S, p, p_0 \).

(ii) Assume that \( f = \nabla \cdot g + b, g = \{g_{ij}\}, g, b \in L_{p,p_0}(\Omega^T), \) and \( u_0 \in B^{2-2/p_0}_{p,p_0}(\Omega) \). Assume the compatibility condition

\[ u_0|_S = 0 \quad \text{if} \quad 1 - 2/p_0 - 1/p > 0. \]

Then there exists a unique solution to \((3.1)\) such that \( u \in W^{1,1/2}_{p,p_0}(\Omega^T) \) and

\[ \|u\|_{W^{1,1/2}_{p,p_0}(\Omega^T)} \leq c(\|g\|_{L_{p,p_0}(\Omega^T)} + \|b\|_{L_{p,p_0}(\Omega^T)} + \|u_0\|_{B^{2-2/p_0}_{p,p_0}(\Omega)}) \]

with a constant \( c \) depending on \( \Omega, S, p, p_0 \).

Let us consider the problem

\begin{align}
  \alpha(x,t)\theta_t - \Delta \theta &= f & \text{in } \Omega^T, \\
  \bar{n} \cdot \nabla \theta &= 0 & \text{on } S^T, \\
  \theta|_{t=0} &= \theta_0 & \text{in } \Omega.
\end{align}

**Lemma 3.7.** Assume that \( f \in L_{p,p_0}(\Omega^T), \theta_0 \in B^{2-2/p_0}_{p,p_0}(\Omega), p, p_0 \in (1, \infty), \) and \( S \in C^2 \). Assume that \( \alpha \geq \alpha_0 > 0, \alpha_0 \) is a constant, \( \alpha \leq \alpha_* < \infty, \alpha_* \) a constant, \( \alpha \in C^{\delta,\delta/2}(\Omega^T), \alpha_t \in L_{1/\mu,1/1-\mu}(\Omega^T), \mu \in (0,1) \). Then there exists a solution to problem \((3.4)\) such that \( \theta \in W^{2,1}_{p,p_0}(\Omega^T) \) and

\[ \|\theta\|_{W^{2,1}_{p,p_0}(\Omega^T)} \leq \varphi(1/\alpha_0, \alpha_*, \|\alpha\|_{C^{\delta,\delta/2}}, \|\alpha_t\|_{L_{1/\mu,1/1-\mu}(\Omega^T)}) \]

\[ \times (\|f\|_{L_{p,p_0}(\Omega^T)} + \|\theta_0\|_{B^{2-2/p_0}_{p,p_0}(\Omega)}). \]
Proof. We prove (3.5) only, because existence follows from the regularizer technique presented in [LSU, Ch. 4 and S2]. Multiplying (3.4)₁ by $\theta$, integrating over $\Omega$ by parts and using the boundary condition (3.4)₂ yields
\[
\frac{1}{2} \frac{d}{dt} \int_{\Omega} \alpha \theta^2 \, dx + \int_{\Omega} |\nabla \theta|^2 \, dx \leq \|f\|_{L^2(\Omega)} \|\theta\|_{L^2(\Omega)} + \int_{\Omega} |\alpha_t| \theta^2 \, dx.
\]
By the Hölder inequality the last term on the r.h.s. of (3.6) is estimated by
\[
\int_{\Omega} |\alpha_t| \theta^2 \, dx \leq \|\alpha_t\|_{L^1(\Omega)} \|\theta\|_{L^2(\lambda_1(\Omega))}^2 \equiv I_1,
\]
where $1/\lambda_1 + 1/\lambda_2 = 1$. Using the interpolation
\[
\|\theta\|_{L^2(\lambda_2(\Omega))} \leq c \|\nabla \theta\|_{L^2(\Omega)}^\mu \|\theta\|_{L^2(\Omega)}^{1-\mu} + c \|\theta\|_{L^2(\Omega)}
\]
with $1/\lambda_2 = 1 - \mu$, $\mu \in (0,1)$, we obtain, for any $\epsilon > 0$,
\[
I_1 \leq c \|\alpha_t\|_{L^1(\lambda_1(\mu)(\Omega)} \|\nabla \theta\|_{L^2(\Omega)}^\mu \|\theta\|_{L^2(\Omega)}^{2(1-\mu)} + \|\theta\|_{L^2(\Omega)}^2
\]
\[
\leq \epsilon \|\nabla \theta\|_{L^2(\Omega)}^2 + \varphi(1/\epsilon) \|\alpha_t\|_{L^1(\lambda_1(\mu)(\Omega)} \|\theta\|_{L^2(\Omega)}^2 + c \|\alpha_t\|_{L^1(\mu)} \|\theta\|_{L^2(\Omega)}^2.
\]
Using (3.6) and taking $\epsilon$ sufficiently small we obtain
\[
\frac{d}{dt} \int_{\Omega} \alpha \theta^2 \, dx + \int_{\Omega} |\nabla \theta|^2 \, dx \leq \|f\|_{L^2(\Omega)} \|\theta\|_{L^2(\Omega)} + c \|\alpha_t\|_{L^1(\lambda_1(\mu)(\Omega)} \|\theta\|_{L^2(\Omega)}^2
\]
\[
+ c \|\alpha_t\|_{L^1(\lambda_1(\mu)(\Omega)} \|\theta\|_{L^2(\Omega)}^2.
\]
Since $\int_{\Omega} \theta^2 \, dx \leq \frac{1}{\alpha_0} \int_{\Omega} \alpha \theta^2 \, dx$ we derive from (3.7) the inequality
\[
\frac{d}{dt} \int_{\Omega} \alpha \theta^2 \, dx + \int_{\Omega} |\nabla \theta|^2 \, dx \leq \frac{1}{\sqrt{\alpha_0}} \|f\|_{L^2(\Omega)} \left( \int_{\Omega} \alpha \theta^2 \, dx \right)^{1/2}
\]
\[
+ c \frac{\|\alpha_t\|_{L^1(\lambda_1(\mu)(\Omega)}^{1/\mu}}{\alpha_0} \int_{\Omega} \alpha \theta^2 \, dx + \frac{c}{\alpha_0} \|\alpha_t\|_{L^1(\mu)(\Omega)} \int_{\Omega} \alpha \theta^2 \, dx.
\]
Omitting the second term on the l.h.s. of (3.8) yields
\[
\frac{d}{dt} \left( \int_{\Omega} \alpha \theta^2 \, dx \right)^{1/2}
\]
\[
\leq \frac{1}{\sqrt{\alpha_0}} \|f\|_{L^2(\Omega)} + c \|\alpha_t\|_{L^1(\lambda_1(\mu)(\Omega)}^{1/\mu}} + \|\alpha_t\|_{L^1(\mu)(\Omega)} \left( \int_{\Omega} \alpha \theta^2 \, dx \right)^{1/2}.
\]
After deriving an estimate for $\left( \int_{\Omega} \alpha \theta^2 \, dx \right)^{1/2}$ from (3.9), we insert it in (3.7). Integrating the result with respect to time yields
\[
\|\theta\|_{V^2(\Omega^t)} \leq \varphi(1/\alpha_0, \|\alpha_t\|_{L^1(\lambda_1(\mu)(\Omega)}), \|f\|_{L^2(\Omega^t)}, \|\theta_0\|_{L^2(\Omega)}).
\]
\[
\times \left[ \|f\|_{L^2(\Omega^t)} + \|\theta_0\|_{L^2(\Omega)} \right], \quad t \leq T.
\]
Using a partition of unity \( \zeta^{(k)}(x, t) \) such that \( \bigcup_k \text{supp} \zeta^{(k)}(x, t) = \Omega \times (0, T) \) and introducing the notation \( u^{(k)} = u\zeta^{(k)} \) we obtain from (3.4) the following problem, localized to \( \text{supp} \zeta^{(k)} \):

\[
\alpha(x, t) \theta^{(k)} - \Delta \theta^{(k)} = [\alpha(x, t) - \alpha(x, t)] \theta^{(k)}_t + f^{(k)} + \alpha^{(k)} \theta - 2\nabla \theta \nabla \zeta^{(k)} - \theta \Delta \zeta^{(k)},
\]

\[
\bar{n} \cdot \nabla \theta^{(k)} = \bar{n} \cdot \nabla \zeta^{(k)} \theta,
\]

\[
\theta^{(k)}|_{t=0} = \theta_0 \zeta^{(k)}|_{t=0},
\]

where \((\xi^{(k)}, t^{(k)})\) is a “middle” point of \( \text{supp} \zeta^{(k)} \). In view of \([K, S1]\) and (3.10) we have

\[
\|\theta^{(k)}\|_{W^{2,1}_{p,p_0}(\Omega^{T})} \leq \varphi(1/\alpha_0, \alpha^*, ||\alpha||_{C^{\delta,\delta/2}}, ||\alpha_0||_{L_{1/\mu,1/1-\mu}(\Omega^t)}) \times \left[ ||f^{(k)}||_{L_{p-p_0}(\Omega^{T})} + \|\theta^{(k)}|_{t=0}\|_{L_{p-p_0}(\Omega)} \right].
\]

Summing up over all subdomains \( \text{supp} \zeta^{(k)}(x, t) \) we obtain (3.5).

4. Lower bound for temperature. The existence of the lower positive bound on the temperature is important in getting an a priori global estimate in this paper. We follow \([PZ1]\) proof of Lemma 4.1, but the argument is different.

**Lemma 4.1.** Assume that (1.2) holds, \( g, \theta_0 > 0 \) and \( A = A(\varepsilon) \). Let

\[
\sigma = 1 \quad \text{and} \quad a_1(t) = \frac{1}{2a_1^*} \sup_{\Omega} |A(\varepsilon)|^2,
\]

where \( a_1^* \) is introduced in (1.19). Then for sufficiently regular solutions to problem (1.1)–(1.4) we have

\[
\theta(t) \geq \theta_0 \exp \left( - \int_0^t \frac{a_1(t')}{c_v} dt' \right) \equiv \theta_*.
\]

Let now

\[
\sigma < 1 \quad \text{and} \quad a_2(t) = \frac{1}{2a_1^*} \lim_{\varphi \to \infty} \|A\|_{L_2(\varphi^{-\sigma+1/2})(\Omega)}^2.
\]

Then for a sufficiently regular solution to (1.1)–(1.4) we have

\[
\theta(t) \geq \left[ \int_0^t \frac{a_2(t')}{c_v} dt' + \left( \frac{1}{\theta_0} \right)^{1-\sigma} \right]^{1/(1-\sigma)} \equiv \theta_*.
\]
Proof. Multiplying (1.2) by \(-\theta^{-\varrho}\) and integrating over \(\Omega\) yields

\[
- c_v \int_{\Omega} \theta^{\sigma-\varrho} \theta_t \, dx + \kappa \int_{\Omega} \theta^{-\varrho} \Delta \theta \, dx + \int_{\Omega} (A_1 \varepsilon_{t} \cdot \varepsilon_{t} \theta^{-\varrho}) \, dx \\
+ \int_{\Omega} g \theta^{-\varrho} \, dx + \int_{\Omega} A(\varepsilon) \cdot \varepsilon_{t} \theta^{1-\varrho} \, dx = 0.
\]

Now we examine the terms in (4.4) one by one. The first term is equal to

\[
\frac{c_v}{\varrho - (\sigma + 1)} \frac{d}{dt} \int_{\Omega} \frac{\theta}{\theta^{-(\sigma+1)}} \, dx.
\]

The second term equals

\[
\frac{4\kappa \varrho}{(\varrho - 1)^2} \int_{\Omega} \left| \frac{1}{\theta^{(\varrho-1)/2}} \right|^2 \, dx.
\]

In view of (1.19) the third term is bounded from below by

\[
a_{1*} \int_{\Omega} \frac{|\varepsilon_{t}|^2}{\theta^{\varrho}} \, dx.
\]

The fourth term is positive because \(g > 0\). From the Cauchy inequality the last term in (4.4) is bounded by

\[
a_{1*} \frac{1}{2} \int_{\Omega} \frac{|\varepsilon_{t}|^2}{\theta^{\varrho}} \, dx + \frac{1}{2a_{1*}} \int_{\Omega} |A(\varepsilon)|^2 \theta^{2-\varrho} \, dx.
\]

In view of the above considerations, (4.4) takes the form

\[
(4.5) \quad \frac{c_v}{\varrho - (\sigma + 1)} \frac{d}{dt} \int_{\Omega} \frac{1}{\theta^{(\varrho-1)}} \, dx + \frac{4\kappa \varrho}{(\varrho - 1)^2} \int_{\Omega} \left| \frac{1}{\theta^{(\varrho-1)/2}} \right|^2 \, dx \\
+ a_{1*} \frac{1}{2} \int_{\Omega} \frac{|\varepsilon_{t}|^2}{\theta^{\varrho}} \, dx + \int_{\Omega} \frac{g}{\theta^{\varrho}} \, dx \leq \frac{1}{2a_{1*}} \int_{\Omega} |A(\varepsilon)|^2 \theta^{2-\varrho} \, dx,
\]

where \(\varrho\) is assumed to be large. Set

\[
(4.6) \quad X = \left( \int_{\Omega} \frac{1}{\theta^{(\varrho-1)}} \, dx \right)^{1-\frac{1}{\varrho-(\sigma+1)}}.
\]

Using (4.6) and assuming that \(a_1(t) = \frac{1}{2a_{1*}} \sup_{\Omega} |A(\varepsilon)|^2\) we obtain

\[
(4.7) \quad \frac{c_v}{\varrho - (\sigma + 1)} \frac{d}{dt} X^{\varrho-(\sigma+1)} \leq a_1(t) \int_{\Omega} \frac{1}{\theta^{\varrho-2}} \, dx.
\]

Setting \(\sigma = 1\) we obtain from (4.7) the inequality

\[
c_v \frac{d}{dt} X \leq a_1(t) X, \quad \text{so} \quad X(t) \leq X(0) \exp \int_0^t \frac{a_1(t')}{c_v} \, dt.
\]
Hence letting \( \varrho \to \infty \) gives
\[
\theta(t) \geq \theta(0) \exp \left[ -\int_0^t \frac{a_1(t')}{c_v} \, dt' \right],
\]
which yields (4.2).

Let us now consider the case \( \sigma < 1 \). Then (4.5) takes the form
\[
\frac{c_v}{\varrho - (\sigma + 1)} \frac{d}{dt} X e^{-(\sigma+1)} \leq \frac{1}{2a_1^*} \| A \|_2^2 \frac{1}{\varrho^{-(\sigma+1)}} \left( \int_{\Omega} \frac{1}{\theta} |g-(\sigma+1)| \, dx \right) \frac{\varrho^{-2}}{\varrho^{-(\sigma+1)}} \equiv a_2(t, \varrho) X e^{-2}.
\]
Hence
\[
\frac{d}{dt} X \leq \frac{a_2(t, \varrho)}{c_v} X^\sigma \quad \text{and} \quad \frac{1}{1 - \sigma} \frac{d}{dt} X^{1-\sigma} \leq \frac{a_2(t, \varrho)}{c_v},
\]
so
\[
X^{1-\sigma}(t) \leq \int_0^t \frac{a_2(t', \varrho)}{c_v} \, dt' + X^{1-\sigma}(0).
\]
Letting \( \varrho \to \infty \) we get
\[
\theta(t) \geq \left[ \frac{1}{\int_0^t (a_2/c_v) \, dt' + (1/\theta_0)^{1-\sigma}} \right]^{1/(1-\sigma)}.
\]
This implies (4.3) and concludes the proof.

5. A priori estimates. In this section we give estimates under the assumption that there exists a sufficiently regular local solution to problem (1.1)–(1.4). The proofs of these estimates are given in [GZ4]. Moreover, Lemma 4.1 implies existence of a constant \( \theta_* > 0 \) such that
\[
\theta(x, t) \geq \theta_*, \quad t \leq T,
\]
where \( T \) is the time of local existence.

**Lemma 5.1.** Assume that \( u_1 \in L_2(\Omega), \ u_0 \in H^1(\Omega), \ \theta_0 \in L_{\sigma+1}(\Omega), \ b \in L_2(\Omega^t), \ 0 < g \in L_1(\Omega^t), \ t \leq T. \) Then solutions to problem (1.1)–(1.4) satisfy
\[
\| u, t(t) \|^2_{L_2(\Omega)} + \| u(t) \|^2_{H^1(\Omega)} + \| \theta(t) \|^2_{L_{\sigma+1}(\Omega)} \leq c(t)(\| b \|^2_{L_2(\Omega^t)} + \| g \|_{L_1(\Omega^t)} + \| u_1 \|^2_{L_2(\Omega)} + \| u_0 \|^2_{H^1(\Omega)} + \| \theta_0 \|^2_{L_{\sigma+1}(\Omega)}) \equiv c_1(t), \quad t \leq T,
\]
where \( c(t) \) is an increasing function.
Lemma 5.2. Assume that \( u_1 \in H^1(\Omega) \), \( b \in L_{2,2}(\Omega^t) \), \( \theta_0 \in L_{\sigma+2}(\Omega) \), \( g \in L_1(0, t; L_{(\sigma+1)/\sigma}(\Omega)) \), \( u_0 \in W^2_2(\Omega) \), \( \sigma > 1/2 \). Then

\[
\int_\Omega \theta^{\sigma+2} \, dx + \| \nabla \theta \|^2_{L_2(\Omega^t)} \leq c(t, c_2),
\]

where

\[
c_2 = \| u_1 \|_{L_2(\Omega)} + \| b \|_{L_2(\Omega^t)} + \| \theta_0 \|_{L_{\sigma+2}(\Omega)} + \| g \|_{L_1(0, t; L_{(\sigma+1)/\sigma}(\Omega))} + \| u_0 \|_{W^2_2(\Omega)}.
\]

From Lemma 5.2 we have

\[
\text{Hence, the Gronwall lemma implies}
\]

\[
\text{Applying Lemma 3.6(ii) to problem (1.1)–(1.4) yields}
\]

\[
\| \varepsilon, t \|_{L_{p,r}(\Omega^t)} \leq c(t) [\| \theta \|_{L_{p,r}(\Omega^t)} + \| b \|_{L_{p,r}(\Omega^t)} + \| u_1 \|_{B^{1-2/r}_{p,r}(\Omega^t)} + \| u_0 \|_{W^1_p(\Omega)}].
\]

Moreover, applying Lemma 3.6(i) to (1.1), (1.3), (1.4) and the Gronwall inequality we obtain

\[
\| \varepsilon, t \|_{W^{1,1/2}_{p,r}(\Omega^t)} \leq c(t) [\| \nabla \theta \|_{L_{p,r}(\Omega^t)} + \| b \|_{L_{p,r}(\Omega^t)} + \| u_1 \|_{B^{2-2/r}_{p,r}(\Omega^t)} + \| u_0 \|_{W^2_p(\Omega)}].
\]

From Lemma 5.2 we have

\[
\theta \in L_\infty(0, t; L_{\sigma+2}(\Omega)),
\]

\[
\theta \in L_2(0, t; L_q(\Omega)), \quad q \in (1, \infty).
\]

In view of (5.7) inequality (5.4) implies

\[
\| \varepsilon, t \|_{L_{\sigma+2,r}(\Omega^t)} \leq c(c_2) + \| b \|_{L_{\sigma+2,r}(\Omega^t)} + \| u_1 \|_{B^{1-1/r}_{\sigma+2,r}(\Omega)} + \| u_0 \|_{W^1_{\sigma+2}(\Omega)}
\]

\[
\equiv c_3, \quad r \in (1, \infty).
\]

Lemma 5.3. Assume that \( b \in L_{2,2}(\Omega^t) \) and \( u_1 \in B^{1/2}_{2,2}(\Omega) \). Then

\[
\| \varepsilon, t \|_{L_{p_1,r_1}(\Omega^t)} \leq c(1 + \| b \|_{L_{2,2}(\Omega^t)} + \| u_1 \|_{B^{1}_{2,2}(\Omega)} + \| u_0 \|_{H^2(\Omega)}) \equiv c_5,
\]

where \( r_1, p_1 \) are such that

\[
1 \leq 2 \left( \frac{1}{p_1} + \frac{1}{r_1} \right).
\]
From (5.3) and (5.6) we have
\[(5.12) \quad \|\varepsilon, t\|_{W^{1,1/2}_{2,2}(\Omega')} \leq c(1 + \|b\|_{L^2_{2,2}(\Omega')} + \|u_1\|_{B^1_{2,2}(\Omega)} + \|u_0\|_{H^2(\Omega)}).
\]
Setting \(r_1 = 2\) we obtain from (5.12) the estimate
\[(5.13) \quad \|\varepsilon, t\|_{L_p(\Omega')} \leq c_3,
\]
where \(p\) is an arbitrary finite number.

**Lemma 5.4.** Assume that \(\theta_0 \in L_{s+\sigma+1}(\Omega), \ g \in L_1(0, t; L_{s+\sigma+1}(\Omega)), \) and \(s \in (1, \infty)\). Then
\[(5.14) \quad \|\theta\|_{L_{s+\sigma+1}(\Omega)} \leq c(c_2, c_3) + c\|g\|_{L_1(0, t; L_{s+\sigma+1}(\Omega))} + c\|\theta_0\|_{L_{s+\sigma+1}(\Omega)} \equiv c_4.
\]

**Lemma 5.5.** Assume that \(b \in L_4(\Omega'), \ u_1 \in B_{3/2}^{3/4}(\Omega), \ u_0 \in W^4_4(\Omega), \ g \in L_2(0, t; L_4(\Omega)), \ \theta_0 \in L_4(\Omega), \ \theta \geq \theta_* > 0.\) Then
\[(5.15) \quad \|\varepsilon, t\|_{L_2(0, t; L_\infty(\Omega))} \leq c_5,
\]
where \(c_5\) depends on all norms from the assumption.

**Lemma 5.6.** Assume that \(g \in L_1(0, T; L_\infty(\Omega)), \ \varepsilon, t \in L_2(0, T; L_\infty(\Omega)), \ \theta_0 \in L_\infty(\Omega), \ \theta \geq \theta_* > 0.\) Then
\[(5.16) \quad \|\theta\|_{L_\infty(\Omega')} \leq c(1/\theta_*)\|\Omega\|c_5 + c_2^2 + \|g\|_{L_1(0, t; L_\infty(\Omega))} + \|\theta_0\|_{L_\infty(\Omega)} \equiv c_6.
\]

To prove the Hölder continuity of the temperature we follow the method of [LSU Ch. 2, Sect. 7]. For this purpose we recall the space \(B_2(\Omega^T, M, \gamma, r, \delta, \varkappa), \ \Omega^T = \Omega \times (0, T), \ \Omega \subset \mathbb{R}^n \) and \(M, \gamma, r, \delta, \varkappa\) are positive constants.

**Definition 5.7.** We say that \(u \in B_2(\Omega^T, M, \gamma, r, \delta, \varkappa)\) if
(1) \(u \in V^{1,0}_2(\Omega^T),\)
(2) \(\text{ess sup}_{\Omega^T} |u| \leq M\)
(3) the function \(w(x, t) = \mp u(x, t)\) satisfies the inequalities
\[
\max_{t_0 \leq t \leq t_0 + \tau} \|(\omega - k)_+\|^2_{L_2(B_{\varrho - \sigma_1\varrho}(x_0))} \leq \|(\omega - k)_+\|^2_{L_2(B_{\varrho}(x_0))} + \gamma[(\sigma_1\varrho)^{-2} + \|\sigma_2\|^2_{L_2(Q(\varrho, \tau))}] + \mu^2(1 + \varepsilon)(k, \varrho, \tau)
\]
and
\[
\|(\omega - k)_+\|^2_{L_2(Q(\varrho - \sigma_1\varrho, \tau - \sigma_2\tau))} \leq \gamma[(\sigma_1\varrho)^{-2} + (\sigma_2\tau)^{-1}][|\omega - k_+|_{L_2(Q(\varrho, \tau))} + \mu^2(1 + \varepsilon)(k, \varrho, \tau)].
\]

Here the following notation is used:
\[
(\omega - k)_+ = \max\{\omega - k, 0\}, \quad k > 0,
B_{\varrho}(x_0) = \{x \in \Omega : |x - x_0| < \varrho\},
Q(\varrho, \tau) = B_{\varrho}(x_0) \times (t_0, t_0 + \tau),
\]
and $\varrho, \tau$ are arbitrary positive numbers, $\sigma_1, \sigma_2 \in (0, 1)$ and $k$ is a positive number such that
\[
\text{ess sup}_{Q(\varrho, \tau)} \omega(x, t) - k < \delta.
\]
Moreover, $V^{1,0}_2(\Omega^T)$ is defined in Section 3
\[
\mu(k; \varrho, \tau) = \int_{t_0}^{t_0+\tau} \text{meas}^{r/q} A_{k, \varrho}(t) \, dt,
\]
where $A_{k, \varrho}(t) = \{ x \in B_{\varrho}(x_0) : \omega(x, t) > k \}$, and the positive numbers $q, r$ are linked by the relation $1/r + n/(2q) = n/4$.

**Lemma 5.8.** Assume $0 < \theta_* \leq \theta$, where $\theta_*$ is defined by (4.1) and (4.2), respectively. Let $M \equiv \| \theta \|_{L_\infty(\Omega^T)} \leq c_6$ (see (5.16)). Let $\sup_{\Omega^T} \theta_0(x) < k$ and $M - k < \delta$ with some $\delta > 0$. Let $\varepsilon_t \in L_{2\lambda}(\Omega^T)$, $g \in L_\lambda(\Omega^T)$, $\lambda = \frac{1}{1 - \frac{2}{r}(1 + \infty)}$, $1/r + 1/q = 1/2$, $\varkappa > 0$. Then
\[
(5.17) \quad \theta \in B_2(\Omega^T, M, \gamma, r, \delta, \varkappa).
\]

**Remark 5.9.** By the imbedding (see [LSU, Ch. 2 Theorem 7.1])
\[
B_2(\Omega^T, M, \gamma, r, \delta, k) \subset C^{\alpha, \alpha/2}(\Omega^T), \quad \alpha \in (0, 1),
\]
it follows from (5.17) that
\[
(5.18) \quad \theta \in C^{\alpha, \alpha/2}(\Omega^T),
\]
where $\alpha$ depends on $M, \gamma, r, \delta, \varkappa$.

**Remark 5.10.** In view of (5.14) and (5.5) we have $\theta, \varepsilon_t \in L_{p,r}(\Omega^T)$, $p, r \in (1, \infty)$. Using this and the Hölder continuity of $\theta$ we get for solutions to problem (1.2), (1.4), (1.3) the estimate
\[
(5.19) \quad \| \theta \|_{W^{2,1}_{q,q_0}(\Omega^T)} \leq \varphi(c_4, c_6, c_0),
\]
where $q, q_0 \in (1, \infty)$. Hence
\[
(5.20) \quad \nabla \theta \in L_{r,r_0}(\Omega^T),
\]
where
\[
(5.21) \quad \frac{2}{q} + \frac{2}{q_0} - \frac{2}{r} - \frac{2}{r_0} \leq 1,
\]
For $q = q_0$ and $r = r_0$ condition (5.21) implies
\[
(5.22) \quad \frac{4}{q} - \frac{4}{r} \leq 1.
\]
Since $q$ can be an arbitrary number from $(1, \infty)$, the same can be said about $r$. 
Similarly, for solutions to problem (1.1), (1.3), (1.4), we have
\begin{equation}
\|u\|_{W^{2,1}_{p,p_0}(\Omega_T)} \leq \varphi(c_0, c_8)
\end{equation}
where \( p, p_0 \in (1, \infty) \).

We are not interested in increasing the regularity of solutions to problem (1.1)–(1.6) as much as possible. We just need enough regularity that the existence of local solutions and that the local solution may be extended in time to get global existence.

6. Local existence. To prove local existence of solutions to problem (1.1)–(1.4) we use the following successive approximations:
\begin{align}
&u_{(n+1),tt} - \nabla \cdot (A_1 \varepsilon(u_{(n+1)})) = \nabla \cdot [A_2 \varepsilon(u_n) + A_\theta(n)] + b \quad \text{in } \Omega^T, \\
&c_v \theta_{(n),t} - \kappa \Delta \theta_{(n+1)} = \theta_{(n)} A_\varepsilon(u_{(n)}),t) + (A_1 \cdot \varepsilon(u_{(n)})) \cdot \varepsilon(u_{(n)},t) + g \quad \text{in } \Omega^T, \\
&u_{(n+1)} = 0, \quad \bar{n} \cdot \nabla \theta_{(n+1)} = 0 \quad \text{on } S^T, \\
&u_{(n+1)}|_{t=0} = u_0, \quad u_{(n+1),t}|_{t=0} = u_1, \quad \theta_{(n+1)}|_{t=0} = \theta_0 \quad \text{in } \Omega,
\end{align}
where \( u_{(n)}, \theta_{(n)} \) are treated as given.

Moreover, the zero approximations \((u_0), (\theta_0)\) are constructed by an extension of the initial data in such a way that
\begin{align}
&u_0|_{t=0} = u_0, \quad u_0|_{t=0} = u_1, \quad \theta_0|_{t=0} = \theta_0 \quad \text{in } \Omega, \\
&u_0 = 0, \quad \bar{n} \cdot \nabla \theta_0 = 0 \quad \text{on } S^T.
\end{align}

First we show uniform boundedness of the sequence \( \{u_{(n)}, \theta_{(n)}\} \).

**Lemma 6.1.** Suppose that \( X_0(t) = \|u_{(0),t}||^{2,1}_{W^{2,1}_{p,p_0}(\Omega T)} + \|\theta_{(0)}||^{2,1}_{W^{2,1}_{q,q_0}(\Omega T)} < \infty \), where \( u_{(0)}, \theta_{(0)} \) are introduced by (6.5). Suppose that \( D(t) = \|u_0||^{2,1}_{W^{2}(\Omega)} + \|u_1||^{2,2/p_0}_{B^{2,2/p_0}(\Omega)} + \|\theta_0||^{2,2/q_0}_{B^{2,2/q_0}(\Omega)} + \|b||^{1}_{L_{p,p_0}(\Omega)} + \|g||^{1}_{L_{q,q_0}(\Omega)} < \infty \). Let \( 1/p + 1/p_0 < 1, 1/q + 1/q_0 < 1, q_0 > 2 \). Assume that there exists a constant \( \bar{A} \) and time \( t \) such that \( X_0(t) \leq \bar{A}, \varphi_1(t^{\alpha} \bar{A}, D(t)) \leq \bar{A}, \alpha > 0 \) and \( \varphi_1 \) is introduced in (6.34), and \( ct^{\alpha/2} \bar{A} \leq \theta_*, \sigma > 0, \theta_* = \min_{\Omega} \theta_0 \). Then
\begin{equation}
X_n(t) = \|u_{(n),t}||^{2,1}_{W^{2,1}_{p,p_0}(\Omega T)} + \|\theta_{(n)}||^{2,1}_{W^{2,1}_{q,q_0}(\Omega T)} \leq \bar{A} \quad \text{for any } n \in \mathbb{N}.
\end{equation}

**Proof.** Applying Lemma 3.6 to problem (6.1), (6.3), (6.4) yields
\begin{equation}
\|u_{(n+1),t'}||^{2,1}_{W^{2,1}_{p,p_0}(\Omega T)} \leq c[\|\nabla^2 u_{(n)}||^{1}_{L_{p,p_0}(\Omega T)} + \|\nabla \theta_{(n)}||^{1}_{L_{p,p_0}(\Omega T)} + \|b||^{1}_{L_{p,p_0}(\Omega)} + \|u_1||^{2,2-2/p_0}_{B^{2-2/p_0}(\Omega)}],
\end{equation}
where \( c \) does not depend on \( t \). With the use of the formula
\begin{equation}
u,(x, t) = \int_{0}^{t} u_{(n),t'}(x, t') \, dt' + u_0(x),
\end{equation}
we have
\begin{equation}
\|u_{(n+1)}||^{2,1}_{W^{2,1}_{p,p_0}(\Omega T)} \leq \bar{A}.
\end{equation}
the first term on the r.h.s. of (6.8) is estimated by

\[(6.9) \quad \|\nabla^2 u_{(n)}\|_{L^p(\Omega^t)} \leq \left\| \int_0^t \nabla^2 u_{(n)}(x, t') dt' \right\|_{L^p(\Omega^t)} + t^{1/p_0} \|\nabla^2 u_0\|_{L^p(\Omega)}

\leq t \|\nabla^2 u_{(n)}(t')\|_{L^p(\Omega^t)} + t^{1/p_0} \|\nabla^2 u_0\|_{L^p(\Omega)}.

Employing (6.9) in (6.8) we get

\[(6.10) \quad \|u_{(n+1),t}\|_{W^{2,1}_{p,p}(\Omega^t)} \leq c \|\nabla \theta_{(n)}\|_{L^p(\Omega^t)} + t \|\nabla^2 u_{(n),t'}\|_{L^p(\Omega^t)} + c(t^{1/p_0} \|\nabla^2 u_0\|_{L^p(\Omega)} + \|b\|_{L^p(\Omega^t)} + \|u_1\|_{B^{2-2/p_0}_{p,p}(\Omega)}).

Next we examine problem (6.2), (6.3)2, (6.4)3. By Lemma 3.7 there exists a solution to this problem and the solution satisfies

\[(6.11) \quad \|\theta_{(n+1)}\|_{W^{2,1}_{q,q_0}(\Omega^t)}

\leq \varphi \left( \sup_{\Omega^t} \frac{1}{\theta_{(n)}}, \sup_{\Omega^t} \theta_{(n)}; \|\theta_{(n)}\|_{C^{\sigma/2}(\Omega^t)}, \|\theta_{(n),t'}\|_{L^2(\Omega^t)} \right)

\times \left[ \|\nabla \theta_{(n)}\|_{L^q(\Omega^t)} + \|\nabla \theta_{(n)}\|_{L^q(\Omega^t)} \right]

+ \|g\|_{L^{q,q_0}(\Omega^t)} + \|\theta_0\|_{B^{2-2/q_0}_{q,q_0}(\Omega)}]

First we estimate the arguments of \(\varphi\). Using Lemma 3.1 we have

\[\|\theta_{(n)}\|_{L^\infty(\Omega^t)} \leq \delta \|\theta_{(n)}\|_{W^{2,1}_{q,q_0}(\Omega^t)} + \varphi(1/\delta) \|\theta_{(n)}\|_{L^q(\Omega^t)}

\leq c_3(t^{\alpha} \|\theta_{(n)}\|_{W^{2,1}_{q,q_0}(\Omega^t)} + \|\theta_0\|_{L^q(\Omega)})

under the restriction

\[(6.12) \quad \frac{1}{q} + \frac{1}{q_0} < 1.

In view of Lemma 3.5 we have

\[\|\theta_{(n)}\|_{C^{\sigma/2}(\Omega^t)} \leq \delta \|\theta_{(n)}\|_{W^{2,1}_{q,q_0}(\Omega^t)} + \varphi(1/\delta) \|\theta_{(n)}\|_{L^q(\Omega^t)}

\leq c_4(t^{\alpha} \|\theta_{(n)}\|_{W^{2,1}_{q,q_0}(\Omega^t)} + \|\theta_0\|_{L^q(\Omega)})

for some \(\alpha > 0\), under the condition

\[(6.13) \quad \frac{2}{q} + \frac{2}{q_0} + \sigma < 2.

Assuming that \(q_0 > 2\) we get

\[\|\theta_{(n),t'}\|_{L^2(\Omega^t)} \leq t^{1/2 - 1/q_0} \|\theta_{(n),t'}\|_{L^{q_0}(\Omega^t)}.

To estimate \(\theta_{(n)}\) from below we consider

\[\theta_{(n)} = \theta_{(n)} - \theta_0 \geq \theta_* - |\theta_{(n)} - \theta_0| \geq \theta_* - \sup_{x \in \Omega} \|\theta_{(n)} - \theta_0\|_{C^{\sigma/2}(\Omega^t)} t^{\sigma/2} \equiv I_1,
where \( \theta_\ast = \min_\Omega \theta_0 \). By Lemma 3.5 we have
\[
\theta_{(n)} \geq I_1 \geq \theta_\ast - c\|\theta_{(n)} - \theta_0\|_{W^{2,1}_{q,q_0}(\Omega^t)} t^{\sigma/2}
\]
under the restriction (6.13). From (6.14) for \( t \) so small that
\[
c\|\theta_{(n)} - \theta_0\|_{W^{2,1}_{q,q_0}(\Omega^t)} t^{\sigma/2} \leq \theta_\ast / 2
\]
we have
\[
\theta_{(n)} \geq \theta_\ast / 2.
\]
Now, we examine the expressions in the square brackets on the r.h.s. of (6.11). By the Hölder inequality the first term is bounded by
\[
\|\theta_{(n)} \varepsilon(u_{(n)},t')\|_{L_{q,q_0}(\Omega^t)} \leq \|\theta_{(n)}\|_{L_{\lambda_1 q,\mu_1 q_0}(\Omega^t)} \|\varepsilon(u_{(n)},t')\|_{L_{\lambda_2 q,\mu_2 q_0}(\Omega^t)} \equiv I_2,
\]
where \( 1/\lambda_1 + 1/\lambda_2 = 1, 1/\mu_1 + 1/\mu_2 = 1 \). The first factor in \( I_2 \) is estimated by (see Lemma 3.1)
\[
\|\theta_{(n)}\|_{L_{\lambda_1 q,\mu_1 q_0}(\Omega^t)} \leq \delta\|\theta_{(n)}\|_{W^{2,1}_{q,q_0}(\Omega^t)} + \varphi(1/\delta)\|\theta_{(n)}\|_{L_{q,q_0}(\Omega^t)} \
\leq c_5 t^\alpha (\|\theta_{(n)}\|_{W^{2,1}_{q,q_0}(\Omega^t)} + \|\theta_0\|_{L_q(\Omega)})
\]
for some \( \alpha > 0 \), under the restriction
\[
\frac{1}{q} + \frac{1}{q_0} - \frac{1}{\lambda_1 q} - \frac{1}{\mu_1 q_0} = \frac{1}{\lambda_2} - \frac{1}{q} + \frac{1}{\mu_2} < 1,
\]
which holds in view of (6.12).

The second factor in \( I_2 \) is bounded, in view of Lemma 3.1, by
\[
\|\varepsilon(u_{(n)},t')\|_{L_{\lambda_2 q,\mu_2 q_0}(\Omega^t)} \leq \delta\|u_{(n)},t'\|_{W^{2,1}_{p,p_0}(\Omega^t)} + \varphi(1/\delta)\|u_{(n)},t'\|_{L_{q,q_0}(\Omega^t)} \
\leq c_6 t^\alpha (\|u_{(n)},t'\|_{W^{2,1}_{p,p_0}(\Omega^t)} + \|u_1\|_{L_p(\Omega)})
\]
under the condition
\[
\frac{2}{p} + \frac{2}{p_0} - \frac{2}{\lambda_2 q} - \frac{2}{\mu_2 q_0} < 2.
\]
From (6.17), (6.18) and the relations between \( \lambda_i, \mu_i, i = 1, 2 \), we have
\[
\frac{1}{p} + \frac{1}{p_0} < 2.
\]
Moreover, the above estimates imply
\[
I_2 \leq c_7 t^\alpha (\|\theta_{(n)}\|_{W^{2,1}_{q,q_0}(\Omega^t)} + \|\theta_0\|_{L_q(\Omega)}) \
\times (\|u_{(n)},t'\|_{W^{2,1}_{p,p_0}(\Omega^t)} + \|u_1\|_{L_p(\Omega)}).
\]
The second term in the square brackets on the r.h.s. of (6.11) is bounded by
\begin{equation}
\| \nabla u(n), t' \|_{L_{q,q_0}^2(\Omega^t)} \leq \| \nabla u(n), t' \|_{L_{2q,2q_0}^2(\Omega^t)}^2 \leq (\delta \| u(n), t' \|_{W_{p,p_0}^{2,1}(\Omega^t)} + \varphi(1/\delta) \| u(n), t' \|_{L_{p,p_0}^2(\Omega^t)})^2 
\end{equation}
under the restriction
\begin{equation}
\frac{2}{p} + \frac{2}{p_0} - \frac{1}{q} - \frac{1}{q_0} < 1
\end{equation}
In view of Lemma 3.1 From (6.8)–(6.10) we have, for some \( \alpha > 0 \),
\begin{equation}
\| u(n+1), t' \|_{W_{p,p_0}^{2,1}(\Omega^t)} \leq \varphi(t^\alpha X_n(t), D(t)).
\end{equation}
From (6.11), (6.20) and (6.21) we obtain
\begin{equation}
\| \theta(n+1) \|_{W_{q,q_0}^{2,1}(\Omega^t)} \leq \varphi(t^\alpha X_n(t), D(t)).
\end{equation}
The above estimates hold under the restrictions (6.12), (6.19) and (6.22). Summarizing, inequalities (6.23) and (6.24) imply
\begin{equation}
X_{n+1}(t) \leq \varphi_1(t^\alpha X_n(t), D(t)).
\end{equation}
Hence, there exists a constant \( \bar{A} \) such that for sufficiently small \( t \),
\begin{equation}
X_0(t) \leq \bar{A}, \quad \varphi_1(t^\alpha \bar{A}, D(t)) \leq \bar{A}.
\end{equation}
Then (6.26) implies
\begin{equation}
X_n(t) \leq \bar{A} \quad \text{for any } n \in \mathbb{N}_0.
\end{equation}
This concludes the proof. □

To show convergence of the sequence \( \{u(n), \theta(n)\} \) we introduce the differences
\begin{equation}
U_n(t) = u(n)(t) - u(n-1)(t), \quad \vartheta_n(t) = \theta(n)(t) - \theta(n-1)(t),
\end{equation}
for \( n \in \mathbb{N} \), which are solutions to the problems
\begin{equation}
\begin{aligned}
U_{n+1,tt} - \nabla \cdot (A_1 \varepsilon(U_{n+1,t})) &= \nabla \cdot (A_2 \varepsilon(U_n)) + \nabla \cdot (A(\theta(n) - \theta(n-1))) & \text{in } \Omega^T, \\
U_{n+1} &= 0 & \text{on } S^T,
\end{aligned}
\end{equation}
\begin{equation}
\begin{aligned}
U_{n+1}|_{t=0} &= 0, & U_{n+1,t}|_{t=0} &= 0 & \text{in } \Omega,
\end{aligned}
\end{equation}
and
\[ c_v \theta_{(n)} \partial_{n+1,t} - \kappa \Delta \theta_{n+1} = -c_v (\theta_{(n)} - \theta_{(n-1)} \theta_{(n),t} \\
+ (\theta_{(n)} - \theta_{(n-1)}) \varepsilon (u_{(n),t}) + \theta_{(n-1)} \varepsilon (U_{n,t}) \\
+ A_1 \varepsilon (U_{n,t}) \cdot \varepsilon (u_{(n),t}) + A_1 \varepsilon (u_{(n-1),t}) \cdot \varepsilon (U_{n,t}) \text{ in } \Omega^T, \\
\tilde{n} \cdot \nabla \theta_{n+1} = 0 \text{ on } S^T, \\
\theta_{n+1}|_{t=0} = 0 \text{ in } \Omega. \]

Let
\[ Y_n(t) = \|U_{n,t'}\|_{W_{p',p_0}^{2,1}(\Omega^t)} + \|\partial_n\|_{L_{p',p_0}^{2,1}(\Omega^t)}. \]

**Lemma 6.2.** Let the assumptions of Lemma 6.1 hold. Then there exists a positive constant \( d \) depending on \( A \) such that for some \( \alpha > 0 \),
\[ Y_{n+1}(t) \leq dt^{\alpha} Y_n(t). \]

**Proof.** Applying Lemma 3.6 to problem \( (6.29) \) yields
\[ \|U_{n+1,t'}\|_{W_{p',p_0}^{2,1}(\Omega^t)} \leq c \|\nabla^2 U_n\|_{L_{p',p_0}^{2,1}(\Omega^t)} + c \|\nabla \partial_n\|_{L_{p',p_0}^{2,1}(\Omega^t)}. \]

By the formula
\[ U_n(t) = \int_0^t U_{n,t'}(t') \, dt', \]
the first term on the r.h.s. of \( (6.33) \) is estimated by
\[ t^{1/p_0'} \|U_{n,t'}\|_{W_{p',p_0}^{2,1}(\Omega^t)}. \]

We will also use the formula
\[ \partial_n(t) = \int_0^t \partial_{n,t'}(t') \, dt'. \]

To estimate the second term on the r.h.s. of \( (6.33) \) we express it in the form
\[ \left( \int_0^t \|\nabla \partial_n(t')\|_{L_{p'}^{p_0}(\Omega)} \, dt' \right)^{1/p_0'} = I_1. \]

Applying the interpolation
\[ \|\nabla \partial_n\|_{L_{p'}^{p_0}(\Omega)} \leq c \|\partial_n\|_{W_{q'}^{2,1}(\Omega)}^{\theta} \|\partial_n\|_{L_{q'}^{q_0}(\Omega)}^{1-\theta} \]
with \( \theta = 1/q' - 1/p' + 1/2 \) yields
\[ I_1 \leq c \sup_t \|\partial_n\|_{L_{q'}^{q_0}(\Omega)}^{1-\theta} \left( \int_0^t \|\partial_n(t')\|_{W_{q'}^{2,1}(\Omega)}^{p_0'\theta} \, dt' \right)^{1/p_0'} \leq c t^{(1-1/q_0')(1-\theta)} \|\partial_n\|_{L_{q'}^{q_0}(\Omega)}^{1-\theta} \|\partial_n\|_{L_{q_0'}^{q_0}(0,t;W_{q'}^{2,1}(\Omega))}^{\theta}. \]
where for the second inequality we have used (6.35) and \( p'_0 \theta \leq q'_0 \). Summa-
izing, we need the restriction
\[
(6.36) \quad p'_0(1/q' - 1/p' + 1/2) \leq q'_0, \quad 0 < 1/q' - 1/p' + 1/2 < 1.
\]

Employing the above estimates in (6.33) yields
\[
(6.37) \quad \|U_{n+1, t'}\|_{W^{2,1}_{q', q'_0}(\Omega^t)} \leq \varphi(\bar{A}) t^\alpha Y_n(t).
\]

Applying Lemma 3.7 to (6.30) gives
\[
(6.38) \quad \|\theta_{n+1}\|_{W^{2,1}_{q', q'_0}(\Omega^t)} \leq \varphi(\bar{A}) \left[ \|\theta_n\|_{L_{q', q'_0}(\Omega^t)} + \|\theta_n\|_{L_{q', q'_0}(\Omega^t)} \right]
\]
\[
+ \|\tilde{E}(U_n, t')\|_{L_{q', q'_0}(\Omega^t)}
\]
\[
+ \|\tilde{E}(U_n, t')\|_{L_{q', q'_0}(\Omega^t)}
\]
\[
+ \|\epsilon(U_n, t')\|_{L_{q', q'_0}(\Omega^t)}.
\]

Now, we examine the particular terms from the r.h.s. of (6.38). The first term in the square brackets is treated as follows:
\[
\|\theta_n\|_{L_{q', q'_0}(\Omega^t)} \leq \left( \int_0^t \|\theta_n\|_{L_{q', q'_0}(\Omega^t)} dt' \right)^{1/q'_0}
\]
\[
\leq \left( \int_0^t \left( \int \left( \int_0^t \theta_n \right)_{L_{q', q'_0}(\Omega^t)} dt' \right)^{1/q'_0} \right)^{1/q'_0} = J_1,
\]
where \( 1/\lambda_1 + 1/\lambda_2 = 1 \). Setting \( \lambda_2 q' = q \), we have \( \lambda_2 = q/q' \) so \( \lambda_1 = q/(q - q') \). Then
\[
J_1 \leq \left( \int_0^t \|\theta_n\|_{L_{q', q'_0}(\Omega^t)} \|\theta_n\|_{L_{q', q'_0}(\Omega^t)} dt' \right)^{1/q'_0} \equiv J_1^1.
\]

We use the interpolation (see Lemma 3.3)
\[
\|\theta_n\|_{L_{q', q'_0}(\Omega^t)} \leq c\|\theta_n\|_{W^{2,1}_{q', q'_0}(\Omega^t)} \|\theta_n\|_{L_{q', q'_0}(\Omega^t)},
\]
where \( \theta \) satisfies the equation
\[
\frac{2}{qq'/(q - q')} = (1 - \theta) \frac{2}{q'} + \theta \left( \frac{2}{q'} - 2 \right).
\]
Solving the equation yields \( \theta = 1/q' \). Then
\[
J_1^1 \leq c\sup_t \|\theta_n\|_{L_{q', q'_0}(\Omega^t)}^{1-1/q'} \left( \int_0^t \|\theta_n\|_{W^{2,1}_{q', q'_0}(\Omega^t)} \|\theta_n\|_{L_{q', q'_0}(\Omega^t)} dt' \right)^{1/q'_0} \equiv J_1^2.
\]
Applying (6.35) and the Hölder inequality to the integrand yields

\[
J_1^2 \leq ct^{1-1/q_0}(1-1/q)\|\vartheta_{n,t'}\|_{L^q_q(t',\Omega')}\left(\int_0^t \|\vartheta_n\|_{W^2_q(\Omega')} dt'\right)^{1/(q_0'\lambda_1)}
\]

\[
\times \left(\int_0^t \|\vartheta_{(n),t'}\|_{L^q_q(\Omega')} dt'\right)^{1/\lambda_2} = J_1^3,
\]

where \(1/\lambda_1 + 1/\lambda_2 = 1\). Setting \(\lambda_1 = q\), we have \(\lambda_2 = q/(q - 1)\). Next, we need \(q_0' q/(q - 1) = q_0\), so \(q_0' = q_0(1 - 1/q)\). Then

\[
J_1^3 \leq t^{1-1/q-1/q_0}\|\vartheta_{n,t'}\|_{L^q_q(t',\Omega')}\|\vartheta_n\|_{L^q_q(t_0;W^2_q(\Omega'))}\|\vartheta_{(n),t'}\|_{L^q(t_0;\Omega')}.
\]

Hence, in view of (6.47) we have

\[
\|\vartheta_{n,t'}\|_{L^q_q(t',\Omega')} \leq t^{1-1/q-1/q_0} A\|\vartheta_n\|_{W^{2,1}_q(t',\Omega')},
\]

where

\[
q_0' = q_0(1 - 1/q).
\]

The second term in the square brackets on the r.h.s. of (6.38) is bounded by

\[
\left(\int_0^t \|\vartheta_n\|_{L^q_q(t',\Omega')}\|\varepsilon(u_{(n),t'})\|_{L^q_q(t',\Omega')} dt'\right)^{1/q_0'} \equiv J_2,
\]

where \(1/\lambda_1 + 1/\lambda_2 = 1\). Applying Lemmas 3.2 and 3.3 we get

\[
J_2 \leq \sup\|\vartheta_n\|_{L^q_q(t',\Omega')}\left(\int_0^t \|\vartheta_n\|_{W^2_q(\Omega')}\|u_{(n),t'}\|_{W^2_q(\Omega')} dt'\right)^{1/q_0'} \equiv J_2^1,
\]

where \(2/p - 2/(\lambda_2 q') \leq 1\) and \(2/\lambda_1 q = (1 - \theta)q + \theta(2 - 2/q)\) so \(\theta = 1/(\lambda_2 q')\). Hence \(2/p - 2/\theta \leq 1\).

Using (6.35) and applying the Hölder inequality to the time integral yields

\[
J_2^1 \leq t^{1-1/q_0}(1-\theta)\|\vartheta_{n,t'}\|_{L^q_q(t',\Omega')}\left(\int_0^t \|\vartheta_n\|_{W^2_q(\Omega')} dt'\right)^{1/(\mu_1 q_0')}
\]

\[
\times \left(\int_0^t \|u_{(n),t'}\|_{W^2_q(\Omega')} dt'\right)^{1/(\mu_2 q_0')} = J_2^3,
\]

where \(1/\mu_1 + 1/\mu_2 = 1\). Setting \(\theta_\mu q_0' = q_0'\) and \(q_0' q_2 = p_0\) we get \(\mu_2 = p_0/q_0',\)

\[
\theta = 1/\mu_1 = 1 - q_0'/p_0.\] But \(\theta\) satisfies \(1/p - \theta \leq 1/2\). Hence

\[
\|\vartheta_{n,t'}\|_{L^q_q(t',\Omega')} \leq t^{(q_0'-1)/p_0} A\|\vartheta_n\|_{W^{2,1}_q(t',\Omega')}
\]

under the restrictions

\[
1/p + q_0'/p_0 \leq 3/2, \quad q_0'/p_0 < 1, \quad 1/p - 1/2 < 1/q'.
\]
The third term in the square brackets in (6.38) is bounded by (see Lemmas 3.2 and 3.3)

\[
\| \varepsilon(U_{n,t}) \|_{L_q^\prime, q_0^\prime} \leq \left( \int_0^t \| U_{n,t'} \|^{q_0^\prime}_W W^{1}_{q^\prime} \, dt' \right)^{1/q_0^\prime} \leq c \left( \int_0^t \| U_{n,t'} \|^{q_0^\prime, (1-\theta)}_L \| U_{n,t'} \|^{q_0^\prime} W^{2}_{q^\prime} \, dt' \right)^{1/q_0^\prime} \equiv J_3,
\]

where \( \theta = 1/p' + 1/2 - 1/q' \) and \( 0 < \theta < 1 \). Continuing, we have

\[
J_3 \leq c \sup_t \| U_{n,t} \|^{1-\theta}_{L_q^\prime} \left( \int_0^t \| U_{n,t'} \|^{q_0^\prime, (1-\theta)}_L \, dt' \right)^{1/q_0^\prime} \equiv J_3^1.
\]

Using the formula

\[
(6.41) \quad U_{n,t} = \int_0^t U_{n,t'} \, dt'
\]

and setting \( q_0^\prime \theta \leq p'_0 \) we obtain

\[
J_3^1 \leq c t^{(1-1/p'_0)(1-\theta)} \| U_{n,t'} \|^{2,1}_{L_q^\prime, p'_0, q_0^\prime} \equiv J_3^1.
\]

where

\[
(6.42) \quad q'_0 \left( \frac{1}{p'} + \frac{1}{2} - \frac{1}{q'} \right) \leq p'_0.
\]

The last two terms in the square brackets on the r.h.s. of (6.38) can be estimated in the same way. Therefore, it remains to examine the last but one term:

\[
\| \varepsilon(U_{n,t}) \|_{L_q^\prime, q_0^\prime} \leq \left( \int_0^t \| \varepsilon(U_{n,t'}) \|^{q_0^\prime}_{L_{\lambda_1 q^\prime}} \| \varepsilon(U_{n,t'}) \|^{q_0^\prime}_{L_{\lambda_2 q^\prime}} \, dt' \right)^{1/q_0^\prime} \equiv J_4,
\]

where \( 1/\lambda_1 + 1/\lambda_2 = 1 \). By Lemmas 3.2 and 3.3 we have

\[
J_4 \leq c \left( \int_0^t \| U_{n,t'} \|^{q_0^\prime, (1-\theta)}_L \| U_{n,t'} \|^{(1-\theta) q_0^\prime} W^{2}_{q^\prime} \, dt' \right)^{1/q_0^\prime} \equiv J_4^1,
\]

where \( \frac{2}{\lambda_1 q} - 1 = (1-\theta) \frac{2}{p'} + \theta \left( \frac{2}{p'} - 2 \right) \) so \( \theta = \frac{1}{p'} + \frac{1}{2} - \frac{1}{\lambda_1 q} \), \( 0 < \theta < 1 \) and \( \frac{2}{p'} - \frac{2}{\lambda_2 q} \leq 1 \). In view of (6.41) we have

\[
J_4^1 \leq c t^{(1-1/p'_0)(1-\theta)} \| U_{n,t'} \|^{1-\theta}_{L_q^\prime, p'_0, q_0^\prime} \leq J_4^2.
\]

\[
\times \left( \int_0^t \| U_{n,t'} \|^{q_0^\prime}_{W^2_{p^\prime}} \| u_{n,t'} \|^{q_0^\prime}_{W^2_{p^\prime}} \, dt' \right)^{1/q_0^\prime} \equiv J_4^2.
\]
Applying the Hölder inequality to the time integral yields

\[
J_4^2 \leq c t \left(1 - \frac{1}{p'_0} \right) \left\| U_{n', t'} \right\|_{L_{p', p'_0}^2(\Omega^t)} \left( \int_0^t \left\| U_{n', t'} \right\|_{W_{p', p'_0}^2(\Omega)}^\theta \, dt' \right)^{1/(q'_0 \mu_1)}
\times \left( \int_0^t \left\| U_{n', t'} \right\|_{W_{p', p'_0}^2(\Omega)}^{q'_0 \mu_2} \, dt' \right)^{1/(q'_0 \mu_2)} \equiv J_4^3,
\]

where \(1/\mu_1 + 1/\mu_2 = 1\). Setting \(\theta q'_0 \mu_1 \leq p'_0\) and \(q'_0 \mu_2 \leq p_0\) we obtain

\[
J_4^3 \leq c \bar{A} t \left(1 - \frac{1}{p'_0} \right) \left\| U_{n', t'} \right\|_{W_{p', p'_0}^{2,1}(\Omega^t)},
\]

where

\[
\frac{q'_0}{p'_0} \left( \frac{1}{p} + \frac{1}{p'} - \frac{1}{q'} \right) \leq 1.
\]

The restrictions (6.36), (6.38), (6.40), (6.42), (6.43) are satisfied if

\[
\left| \frac{1}{q'} - \frac{1}{p'} \right| < \frac{1}{2}, \quad q'_0 \frac{1}{p'} \leq 1, \quad \frac{1}{p} < \frac{1}{2}, \quad \frac{q'_0}{p_0} \leq 1,
\]

\(q'_0 = q_0 - 1 < p_0\). Hence the lemma is proved. \(\blacksquare\)

**Theorem 6.3 (local existence).** Let the assumptions of Lemma 6.1 hold. Then for a sufficiently small time \(T\) there exists a solution to problem (1.1)–(1.6) such that there exists a constant \(\bar{A}\) depending on \(D\) and \(T\) and

\[
X(t) = \left\| u_{n', t'} \right\|_{W_{p, p_0}^{2,1}(\Omega^t)} + \left\| \theta \right\|_{W_{q, q_0}^{2,1}(\Omega^t)} \leq \bar{A}
\]

for all \(t \leq T\).

**7. Proof of the Main Theorem.** To prove global existence of solutions to problem (1.1)–(1.4) we need the existence of local solutions showed in Section 6 and the global a priori estimates stated in Section 5. Then global existence is proved step by step in time. In Section 6 we proved local existence of solutions such that

\[
(7.1) \quad u_{n', t} \in W_{p, p_0}^{2,1}(\Omega^T), \quad \theta \in W_{q, q_0}^{2,1}(\Omega^T),
\]

\[
\frac{1}{p} + \frac{1}{p_0} < 1, \quad \frac{1}{q} + \frac{1}{q_0} < 1, \quad q_0 > 2.
\]

To prove (7.1) we need the following regularity of data:

\[
(7.2) \quad b \in L_{p, p_0}(\Omega^T), \quad u_0 \in W_{p}^{2}(\Omega), \quad u_1 \in B_{p, p_0}^{2-2/p_0}(\Omega),
\]

\[
\theta_0 \in B_{q, q_0}^{2-2/q_0}(\Omega), \quad \theta \in L_{q, q_0}(\Omega^t).
\]
To show global estimates in Section 5 we need (see Lemmas 5.5, 5.6, 5.8, Corollary 5.9)

\[(7.3)\]
\[g \in L_1(0,T;L_\infty(\Omega)) \cap L_2(0,T;L_4(\Omega)), \quad b \in L_4(\Omega^t),\]
\[u_1 \in B_{4,4}^{3/2}(\Omega), \quad u_0 \in W_4^2(\Omega), \quad \theta_0 \in C^\alpha(\Omega), \quad \alpha > 0, \quad \theta \geq \theta_* > 0.\]

In view of the imbedding
\[
\|\theta_0\|_{C^\alpha(\Omega)} \leq c\|\theta_0\|_{B_{q,q_0}^{2-2/q_0}(\Omega)}, \quad \frac{2}{q} + \frac{2}{q_0} + \alpha < 1,
\]
we see that (7.2) and (7.3) are compatible if
\[g \in L_{q,q_0}(\Omega^T) \cap L_1(0,T;L_\infty(\Omega)).\]

This concludes the proof.

Uniqueness can be proved in the standard way.

Acknowledgments. The authors thank the referee for important and valuable comments.
